# collaborative Protection Profile for Network Devices

Version 2.1

24-September-2018

# Acknowledgements

This collaborative Protection Profile (cPP) was developed by the Network international Technical Community with representatives from industry, Government agencies, Common Criteria Test Laboratories, and members of academia.

# 0. Preface

# 0.1 Objectives of Document

This document presents the Common Criteria (CC) collaborative Protection Profile (cPP) to express the security functional requirements (SFRs) and security assurance requirements (SARs) for a network device. The Evaluation Activities that specify the actions the evaluator performs to determine if a product satisfies the SFRs captured within this cPP are described in [SD].

# 0.2 Scope of Document

The scope of the cPP within the development and evaluation process is described in the Common Criteria for Information Technology Security Evaluation [CC]. In particular, a cPP defines the IT security requirements of a generic type of TOE and specifies the functional and assurance security measures to be offered by that TOE to meet stated requirements [CC1, Section C.1].

# 0.3 Intended Readership

The target audiences of this cPP are developers, CC consumers, system integrators, evaluators and schemes.

Although the cPPs and SDs may contain minor editorial errors, cPPs are recognized as living documents and the iTCs are dedicated to ongoing updates and revisions. Please report any issues to the NDFW iTC.

# 1. PP Introduction

### 1.1 PP Reference Identification

PP Reference: collaborative Protection Profile for Network Devices

PP Version: 2.1

PP Date: 24-September-2018

#### 1.2 TOE Overview

This is a Collaborative Protection Profile (cPP) whose Target of Evaluation (TOE) is a network device. It provides a minimal set of security requirements expected by all network devices that target the mitigation of a set of defined threats. This baseline set of requirements will be built upon by future cPPs to provide an overall set of security solutions for networks up to carrier and enterprise scale. A network device in the context of this cPP is a device composed of both hardware and software that is connected to the network and has an infrastructure role within the network. The TOE may be standalone or distributed, where a distributed TOE is one that requires multiple distinct components to operate as a logical whole in order to fulfil the requirements of this cPP (a more extensive description of distributed network device TOEs is given in section 3).

A Virtual Network Device (vND) is a software implementation of network device functionality that runs inside a virtual machine. This cPP expressly excludes evaluation of vNDs unless the product is able to meet all the requirements and assumptions of a physical ND as required in this cPP

#### This means:

- The virtualisation layer (or hypervisor or Virtual Machine Manager (VMM)) is considered part of the ND's software stack, and thus is part of the TOE and must satisfy the relevant SFRs (e.g. by treating hypervisor Administrators as Security Administrators)<sup>2</sup>. vNDs that can run on multiple VMMs must be tested on each claimed VMM unless the vendor can successfully argue equivalence.
- The physical hardware is likewise included in the TOE (as in the example included above). vNDs must be tested for each claimed hardware platform unless the vendor can successfully argue equivalence.
- There is only one vND instance for each physical hardware platform.
- There are no other guest VMs on the physical platform providing non-network device functionality.

\_

<sup>&</sup>lt;sup>2</sup> It may be useful to iterate the relevant SFRs in a Security Target to cover properties of the virtualisation software separately.

The intent of this document is to define the baseline set of common security functionality expected by all network devices, regardless of their ultimate security purpose or any additional security functionality the device may employ. This baseline set includes securing any remote management path, providing identification and authentication services for both local and remote logins, auditing security-related events, cryptographically validating the source of any update, and offering some protection against common network-based attacks.

The aim is that any network device that meets this cPP will "behave well" on the network and can be trusted to do no harm. To accomplish this, the network device is expected to employ standards-based tunnelling protocols to include IPsec, TLS/DTLS, or SSH to protect the communication paths to external entities, and in the case of a distributed TOE, to protect the communications between TOE components. For most of the allowed secure channel protocol selections it is also required that X.509 certificates be used for authentication purposes; use of certificates is supported as an option for code signing/digital signatures.

Additional security functionality that a network device may employ is outside the scope of this cPP, and such functionality will be specified in other device-type specific cPPs. Also considered out of scope are virus and emailing scanning, intrusion detection/prevention capabilities, Network Address Translation (NAT) as a security function, and virtualized network functions, except in the case outlined above. It is expected that this cPP will be updated to expand the desired security functionality to increase resiliency, allow for varying implementations (such as software-only network devices), and keep current with technology enhancements. At this time, however, Exact Conformance<sup>3</sup> with the cPP is required, and no additional functionality will be evaluated.

### 1.3 TOE Use Cases

The essence of the requirements for network device TOEs is that the devices can be remotely managed in a secure manner and that any software updates applied are from a trusted source. Examples of network devices that are covered by requirements in this cPP include routers, firewalls, VPN gateways, IDSs, and switches. Where such devices include significant additional functionality with its own distinct security requirements, then a separate cPP may be created to be used for those devices, with that cPP containing a superset of the network device cPP requirements. For example, a separate cPP of this sort has been created for Stateful Traffic Filter Firewalls.

Examples of devices that connect to a network but are not included to be evaluated against this cPP include mobile devices, end-user workstations, and virtualized network device functionality.

<sup>&</sup>lt;sup>3</sup> Exact Conformance is specified as a subset of Strict Conformance – see the definition in section 2.

# 2. CC Conformance

As defined by the references [CC1], [CC2] and [CC3], this cPP:

- conforms to the requirements of Common Criteria v3.1, Revision 5
- is Part 2 extended, Part 3 conformant
- does not claim conformance to any other PP.

The methodology applied for the cPP evaluation is defined in [CEM]. This cPP satisfies the following Assurance Families: APE\_CCL.1, APE\_ECD.1, APE\_INT.1, APE\_OBJ.1, APE\_REQ.1 and APE\_SPD.1.

In order to be conformant to this cPP, a TOE must demonstrate Exact Conformance. Exact Conformance, as a subset of Strict Conformance as defined by the CC, is defined as the ST containing all of the SFRs in section 6 (these are the mandatory SFRs) of this cPP, and potentially SFRs from Appendix A (these are optional SFRs) or Appendix B (these are selection-based SFRs, some of which will be mandatory according to the selections made in other SFRs) of this cPP. While iteration is allowed, no additional requirements (from the CC parts 2 or 3, or definitions of extended components not already included in this cPP) are allowed to be included in the ST. Further, no SFRs in section 6 of this cPP are allowed to be omitted.

The packages to which exact conformance can be claimed in conjunction with this PP are specified in the 'Allowed Packages' list at https://ccusersforum.onlyoffice.com/products/files/doceditor.aspx?fileid=5615628&action=vi ew. The PP-Modules that are allowed to specify this cPP as a base-PP are specified in the 'Allowed PP-Modules list at https://ccusersforum.onlyoffice.com/products/files/doceditor.aspx?fileid=5615628&action=vi ew

# 3. Introduction to Distributed TOEs

This cPP includes support for distributed network device TOEs. Network devices can sometimes be composed of multiple components operating as a logical whole. Oftentimes we see this architecture when dealing with products where a centralized management console is used to provide administration to dispersed components.

Distributed TOEs might consist of combinations of different and similar/same types TOE components where 'type' is referring to the intended use of a component inside the overall TOE. TOE component types could for example be sensors (e.g. for IDS components) or TOE component acting as central nodes managing other nodes.

There are a number of different architectures; but fundamentally, they are variations of the following model where the SFRs of this cPP can only be fulfilled if the two components are deployed and operate together.

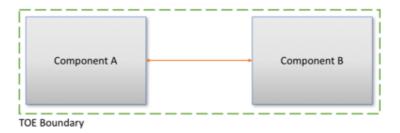

Figure 1: Generalized Distributed TOE Model

# 3.1 Supported Distributed TOE Use Cases

The following discussion provides guidance over the supported distributed TOE use cases in this version of the cPP.

### Case 1: cPP requirements can only be fulfilled if several TOE components work together

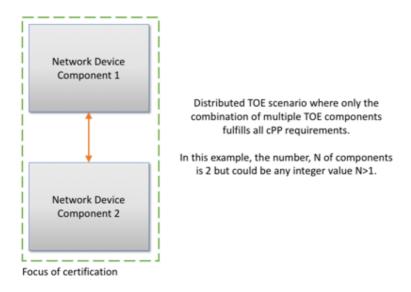

Figure 2: Basic distributed TOE use case

The first and most basic use case is where multiple interconnected network device components need to operate together to fulfil the requirements of the cPP. To be considered a distributed TOE, a minimum of 2 interconnected components are required.

### Case 2: cPP requirements can be fulfilled without Management component.

Some network devices are designed to operate alongside a Management Component. A network device that operates in this manner but can satisfy all SFRs of the cPP without the Management Component shall not be regarded as a distributed TOE and shall be certified according to this cPP without the Management Component

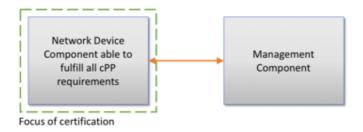

Figure 3: Non-distributed TOE use case

Alternatively, a Network Device may require more than one component in order to fulfil all of the requirements of the cPP. In addition to the components required to fulfil the cPP a Management Component may also be offered for use with the TOE. However, as with the case shown in Figure 3 above, certification shall not include the Management Component in this case. This situation is depicted in Figure 4.

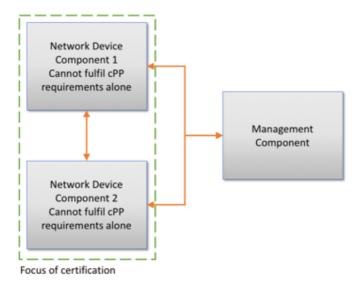

Figure 4: Distributed TOE use case with Management Component out of scope

For the cases in both Figure 3 and Figure 4, the Management Component may be certified separately according to a different (c)PP.

## Case 3: cPP requirements cannot be fulfilled without Management Component

A Network Device that requires the Management Component to satisfy all SFRs of the cPP shall be considered to be a distributed TOE and be certified according to this cPP together with the Management Component.

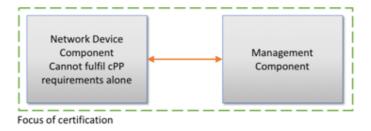

Figure 5: Management Component required to fulfil cPP requirements

A Management Component may also be considered part of the distributed TOE alongside multiple distributed Network Devices if it is required to fulfil all SFRs of this cPP.

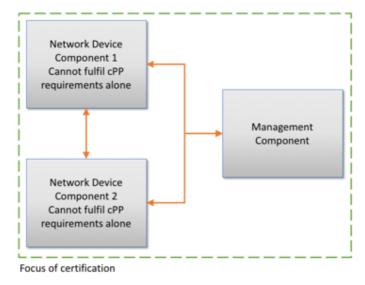

Figure 6: Distributed Network Devices plus Management Component required to fulfil cPP requirements

Where several Network Devices are managed by one Management Component, the TOE may also be considered to be distributed but the focus of the certification should be restricted to the simplest combination of Network Device and Management Component. By the use of an equivalency argument, the combination of multiple Network Devices together with one Management Component can then be regarded as certified solution<sup>4</sup>.

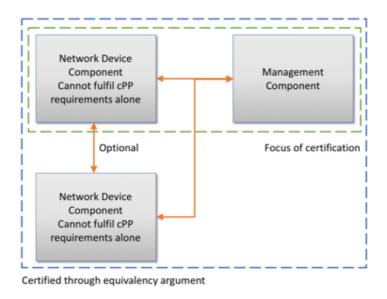

Figure 7 Distributed TOE extended through equivalency argument

<sup>&</sup>lt;sup>4</sup> [SD, B.4] describes how to define the components of a distributed TOE in terms of a "minimum configuration" and allowance for iteration of equivalent components.

In this model the individual Network Device components rely on functionality within the Management Component to fulfil the requirements of this cPP and therefore a direct relationship between Network Device components themselves is optional.

More than one Management Component may be used if it is for the sole purpose of redundancy.

# 3.2 Unsupported Distributed TOE Use Cases

The following discussion provides guidance for the distributed TOE use cases that are not supported by this version of the cPP.

# Case 4: cPP requirements depend on using Management Component shared with other components outside the distributed TOE

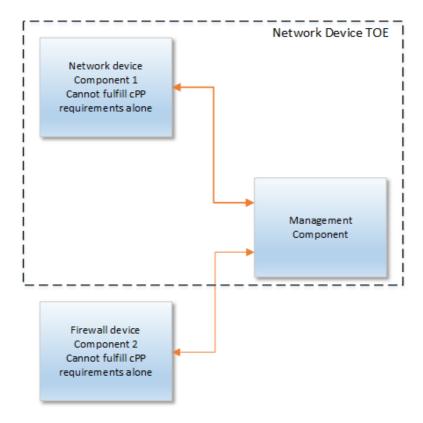

Figure 8 Unsupported Enterprise Management use case

Although apparently similar to Use Case 3 above, in this case a single Management Component is shared between the distributed Network Device TOE and another distinct product (Figure 8 shows an example in which the other product is a Firewall device). In this case the Management Component is considered to be an "Enterprise Manager" (a central management component for different types of devices), and this use case is not supported by this version of the cPP. A similar situation would apply if any other Network Device TOE component was shared with another product.

### Case 5: cPP requirements cannot be fulfilled without multiple Management Components

The case where one device, distributed TOE or combination of TOEs according to Case 3 above are managed by more than one Management Component (except for the purpose of redundancy) is not covered by this version of the cPP.

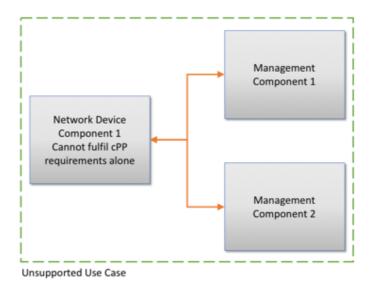

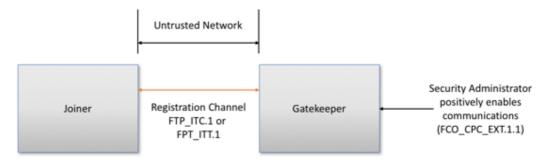

Figure 9 Unsupported use case with Multiple Management Components

# 3.3 Registration of components of a distributed TOE

When dealing with a distributed TOE, a number of separate components need to be brought together in the operational environment in order to create the TOE: this requires that trusted communications channels are set up between certain pairs of components (it is assumed that all components need to communicate with at least one other component, but not that all components need to communicate with all other components).

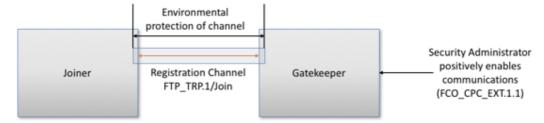

The underlying model for creation of the TOE is to have a "registration process" in which components "join" the TOE. The registration process starts with two components, one of which (the "joiner") is about to join an existing TOE by registering with the other (the "gatekeeper"). The two components will use one or more specified authentication and communication channel options so that the components authenticate each other and protect any sensitive data that is transmitted during the registration process (e.g. a key might be sent by a gatekeeper to the joiner as a result of the registration). The following figures illustrate the three supported registration models. Figure 10 illustrates a distributed TOE registration approach which uses an instance of FPT\_ITT.1 or FTP\_ITC.1 to protect the registration exchange.

- 1) Registration may be performed over any untrusted network
- 2) Registration performed over IPsec, TLS, SSH or HTTPS channel
- 3) Choose FPT\_ITT.1 if certificate revocation checking is not performed
- 4) Choose FTP\_ITC.1 if certificate revocation checking is performed
- 5) Registration channel may be re-used for internal TSF communications

Figure 10 Distributed TOE registration using channel satisfying FPT ITT.1 or FTP ITC.1

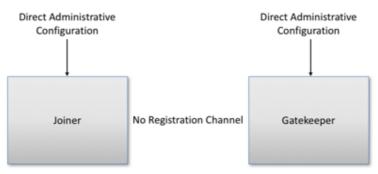

The second approach (Figure 11) utilises an alternative registration channel and supports usecases where the channel relies on environmental security constraints to provide the necessary protection of the registration exchange.

- Registration channel must be authenticated, provide integrity protection and optionally confidentiality
- Registration channel relies on environmental constraints for some aspects of its protection, or to increase strength of protection, e.g. direct physical connection between Joiner and Gatekeeper (FTP\_TRP.1.3/Join)
- Registration channel <u>must</u> not be re-used and must be replaced after registration is complete with internal TSF channel that satisfies either FPT\_ITT.1 or FTP\_ITC.1

Figure 11 Distributed TOE registration using channel satisfying FTP TRP.1/Join

The final approach (Figure 12) supports use-cases where registration is performed manually through direct configuration of both the joiner and gatekeeper devices. Once configured, the two components establish an internal TSF channel that satisfies FPT\_ITT.1 or FTP\_ITC.1.

- Joiner and Gatekeeper are manually pre-configured with information necessary to build inter-TOE communications channel
- Once configured, Joiner and Gatekeeper establish internal TSF channel that satisfies either FPT\_ITT.1 or FTP\_ITC.1

Figure 12 Distributed TOE registration without a registration channel

In each case, during the registration process, the Security Administrator must positively enable the joining components before it can act as part of the TSF. The following figure illustrates the approaches that this enablement step may take;

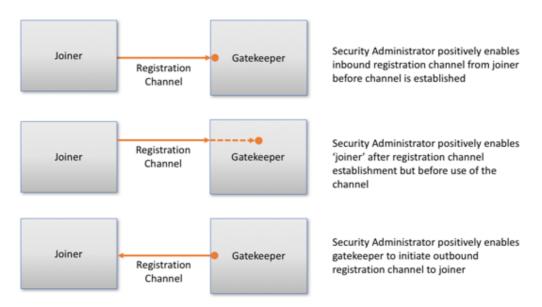

Figure 13 Joiner enablement options for Distributed TOEs

Note that in the case where no registration channel is required, that is the joiner and gatekeeper are directly configured (Figure 12), enablement is implied as part of this direct configuration process.

After registration the components will communicate between themselves using a normal SSH/TLS/DTLS/IPsec/HTTPS channel (which is specified in an ST as an instance of FTP\_ITC.1 or FPT\_ITT.1 in terms of section 6 and appendix A). This channel for intercomponent communications is specified at the top level with the new (extended) SFR FCO\_CPC\_EXT.1 (see section A.6.1) and is in addition to the other communication channels

required for communication with entities outside the TOE (which are specified in an ST as instances of FTP ITC.1 and FTP TRP.1).

# 3.4 Allocation of Requirements in Distributed TOEs

For a distributed TOE, the security functional requirements in this cPP need to be met by the TOE as a whole, but not all SFRs will necessarily be implemented by all components. The following categories are defined in order to specify when each SFR must be implemented by a component:

- All Components ("All") All components that comprise the distributed TOE must independently satisfy the requirement.
- At least one Component ("One") This requirement must be fulfilled by at least one component within the distributed TOE.
- Feature Dependent ("Feature Dependent") These requirements will only be fulfilled where the feature is implemented by the distributed TOE component (note that the requirement to meet the cPP as a whole requires that at least one component implements these requirements if they are specified in section 6).

Table 1 specifies how each of the SFRs in this cPP must be met, using the categories above.

Requirement	Description	Distributed TOE SFR Allocation
FAU_GEN.1	Audit Data Generation	All
FAU_GEN.2	User Identity Association	All
FAU_GEN_EXT.1	Security Audit Data Generation for Distributed TOE component	All
FAU_STG_EXT.1	Protected Audit Event Storage	All
FAU_STG.1	Protected Audit Trail Storage	Feature Dependent
FAU_STG_EXT.2/LocSpace	Counting Lost Audit Data	Feature Dependent
FAU_STG.3/LocSpace	Display warning for local storage space	Feature Dependent

FAU_STG_EXT.3	Protected Local Audit Event Storage for Distributed TOEs	Feature Dependent
FAU_STG_EXT.4	Protected Remote Audit Event Storage for Distributed TOEs	Feature Dependent
FCO_CPC_EXT.1	Communication Partner Control	All
FCS_CKM.1	Cryptographic Key Generation	One <sup>5</sup>
FCS_CKM.2	Cryptographic Key Establishment	All
FCS_CKM.4	Cryptographic Key Destruction	All
FCS_COP.1/DataEncryption	Cryptographic Operation (AES Data Encryption/Decryption)	All
FCS_COP.1/SigGen	Cryptographic Operation (Signature Verification)	All
FCS_COP.1/Hash	Cryptographic Operation (Hash Algorithm)	All
FCS_COP.1/KeyedHash	Cryptographic Operation (Keyed Hash Algorithm)	All
FCS_DTLSC_EXT.1	DTLS client	Feature Dependent
FCS_DTLSC_EXT.2	DTLS client with mutual authentication	Feature Dependent

\_

<sup>&</sup>lt;sup>5</sup> Each component of a distributed TOE will be required either to perform on-board key generation and (if the TOE uses X.509 certificates as in Appendix B.4.1) RFC 2986 Certificate Request generation, or else to receive its keys and certificates, generated on some other component of the TOE, using a secure registration channel at the point where the component is joined to the TOE. (subsequent changes of keys and certificates may then use the post-registration inter-component secure channel). Certificate request generation will be required from either the component that generates the key or the component that receives the key.

FCS_DTLSS_EXT.1	DTLS server	Feature Dependent
FCS_DTLSS_EXT.2	DTLS server with mutual authentication	Feature Dependent
FCS_HTTPS_EXT.1	HTTPS Protocol	Feature Dependent
FCS_IPSEC_EXT.1	IPsec Protocol	Feature Dependent
FCS_NTP_EXT.1	NTP Protocol	Feature Dependent
FCS_SSHC_EXT.1	SSH Client	Feature Dependent
FCS_SSHS_EXT.1	SSH Server	Feature Dependent
FCS_TLSC_EXT.1	TLS Client	Feature Dependent
FCS_TLSC_EXT.2	TLS Client with authentication	Feature Dependent
FCS_TLSS_EXT.1	TLS Server	Feature Dependent
FCS_TLSS_EXT.2	TLS Server with mutual authentication	Feature Dependent
FCS_RBG_EXT.1	Random Bit Generation	All
FIA_AFL.1	Authentication Failure Management	One
FIA_PMG_EXT.1	Password Management	One
FIA_UIA_EXT.1	User Identification and Authentication	One
FIA_UAU_EXT.2	Password-based Authentication Mechanism	One
FIA_UAU.7	Protected Authentication Feedback	Feature Dependent
FIA_X509_EXT.1/Rev	X.509 Certification Validation	Feature Dependent
FIA_X509_EXT.1/ITT	X.509 Certification Validation	Feature Dependent

FIA_X509_EXT.2	X.509 Certificate	Feature Dependent
	Authentication	
FIA_X509_EXT.3	Certificate Requests	Feature Dependent <sup>5</sup>
FMT_MOF.1/ManualUpdate	Trusted Update - Management of Security Functions behaviour	All
FMT_MOF.1/Services	Trusted Update - Management of TSF Data	Feature Dependent
FMT_MOF.1/Functions	Management of security functions behaviour	Feature Dependent
FMT_MTD.1/CoreData	Management of TSF Data	All
FMT_MTD.1/CryptoKeys	Management of TSF Data	Feature Dependent
FMT_SMF.1	Specification of Management Functions	Feature Dependent
FMT_SMR.2	Restrictions on Security Roles	One
FPT_SKP_EXT.1	Protection of TSF Data (for reading of all symmetric keys)	All
FPT_APW_EXT.1	Protection of Administrator Passwords	Feature Dependent
FPT_TST_EXT.1	Testing (Extended)	All
FPT_ITT.1	Basic internal TSF data transfer protection	Feature Dependent <sup>6</sup>
FPT_STM_EXT.1	Reliable Time Stamps	All

<sup>&</sup>lt;sup>6</sup> To protect inter-TSF data transfer, FPT\_ITT.1 or FTP\_ITC.1 must be fulfilled by each distributed TOE component. This is in addition to an iteration of FTP\_ITC.1 to protect communications with external entities.

FPT_TST_EXT.2	Self-Test Based on Certificates	Feature Dependent
FPT_TUD_EXT.1	Trusted Update	All
FPT_TUD_EXT.2	Trusted Update based on Certificates	Feature Dependent
FTA_SSL.3	TSF-initiated Termination	Feature Dependent
FTA_SSL.4	User-Initiated Termination	Feature Dependent
FTA_SSL_EXT.1	TSF-Initiated Session Locking	Feature Dependent
FTA_TAB.1	Default TOE Access Banner	One
FTP_ITC.1	Inter-TSF Trusted Channel (Refinement)	One
FTP_TRP.1/Admin	Trusted Path (Refinement)	One
FTP_TRP.1/Join	Trusted Path	Feature Dependent
FMT_MOF.1/ManualUpdate	Management of security functions behaviour	Feature Dependent
FMT_MOF.1/AutoUpdate	Management of security functions behaviour	Feature Dependent

Table 1: Security Functional Requirements for Distributed TOEs

The ST for a distributed TOE must include a mapping of SFRs to each of the components of the TOE. (Note that this deliverable is examined as part of the ASE\_TSS.1 and AVA\_VAN.1 Evaluation Activities as described in [SD, 5.1.2] and [SD, 5.6.1.1] respectively.) The ST for a distributed TOE may also introduce a "minimum configuration" and identify components that may have instances added to an operational configuration without affecting the validity of the CC certification. [SD, B.4] describes Evaluation Activities relating to these equivalency aspects of a distributed TOE (and hence what is expected in the ST).

# 4. Security Problem Definition

A network device has a network infrastructure role that it is designed to provide. In doing so, the network device communicates with other network devices and other network entities (i.e. entities not defined as network devices because they do not have an infrastructure role) over the network. At the same time, it must provide a minimal set of common security functionality expected by all network devices. The security problem to be addressed by a compliant network device is defined as this set of common security functionality that addresses the threats that are common to network devices, as opposed to those that might be targeting the specific functionality of a specific type of network device. The set of common security functionality addresses communication with the network device, both authorized and unauthorized, the ability to perform valid and secure updates, the ability to audit device activity, the ability to securely store and utilize device and Administrator credentials and data, and the ability to self-test critical device components for failures.

### 4.1 Threats

The threats for the Network Device are grouped according to functional areas of the device in the sections below. The description of each threat is then followed by a rationale describing how it is addressed by the SFRs in section 6, appendix A, and appendix B.

#### 4.1.1 Communications with the Network Device

A network device communicates with other network devices and other network entities. The endpoints of this communication can be geographically and logically distant and may pass through a variety of other systems. The intermediate systems may be untrusted providing an opportunity for unauthorized communication with the network device or for authorized communication to be compromised. The security functionality of the network device must be able to protect any critical network traffic (administration traffic, authentication traffic, audit traffic, etc.). The communication with the network device falls into two categories: authorized communication and unauthorized communication.

Authorized communication includes network traffic allowable by policy destined to and originating from the network device as it was designed and intended. This includes critical network traffic, such as network device administration and communication with an authentication or audit logging server, which requires a secure channel to protect the communication. The security functionality of the network device includes the capability to ensure that only authorized communications are allowed and the capability to provide a secure channel for critical network traffic. Any other communication with the network device is considered unauthorized communication. (Network traffic traversing the network device but not ultimately destined for the device, e.g. packets that are being routed, are not considered to be "communications with the network device" – cf. A.NO\_THRU\_TRAFFIC\_PROTECTION in section 4.2.3.)

The primary threats to network device communications addressed in this cPP focus on an external, unauthorized entity attempting to access, modify, or otherwise disclose the critical network traffic. A poor choice of cryptographic algorithms or the use of non-standardized tunnelling protocols along with weak Administrator credentials, such as an easily guessable password or use of a default password, will allow a threat agent unauthorized access to the

device. Weak or no cryptography provides little to no protection of the traffic allowing a threat agent to read, manipulate and/or control the critical data with little effort. Non-standardized tunnelling protocols not only limit the interoperability of the device but lack the assurance and confidence standardization provides through peer review.

### 4.1.1.1 T.UNAUTHORIZED ADMINISTRATOR ACCESS

Threat agents may attempt to gain Administrator access to the network device by nefarious means such as masquerading as an Administrator to the device, masquerading as the device to an Administrator, replaying an administrative session (in its entirety, or selected portions), or performing man-in-the-middle attacks, which would provide access to the administrative session, or sessions between network devices. Successfully gaining Administrator access allows malicious actions that compromise the security functionality of the device and the network on which it resides.

#### SFR Rationale:

- The Administrator role is defined in FMT\_SMR.2 and the relevant administration capabilities are defined in FMT\_SMF.1 and FMT\_MTD.1/CoreData, with optional additional capabilities in FMT\_MOF.1/Services and FMT\_MOF.1/Functions
- The actions allowed before authentication of an Administrator are constrained by FIA\_UIA\_EXT.1, and include the advisory notice and consent warning message displayed according to FTA\_TAB.1
- The requirement for the Administrator authentication process is described in FIA UAU EXT.2
- Locking of Administrator sessions is ensured by FTA\_SSL\_EXT.1 (for local sessions), FTA\_SSL.3 (for remote sessions), and FTA\_SSL.4 (for all interactive sessions)
- The secure channel used for remote Administrator connections is specified in FTP TRP.1/Admin
- (Malicious actions carried out from an Administrator session are separately addressed by T.UNDETECTED ACTIVITY)
- (Protection of the Administrator credentials is separately addressed by T.PASSWORD\_CRACKING).

### 4.1.1.2 T.WEAK\_CRYPTOGRAPHY

Threat agents may exploit weak cryptographic algorithms or perform a cryptographic exhaust against the key space. Poorly chosen encryption algorithms, modes, and key sizes will allow attackers to compromise the algorithms, or brute force exhaust the key space and give them unauthorized access allowing them to read, manipulate and/or control the traffic with minimal effort.

## SFR Rationale:

- Requirements for key generation and key distribution are set in FCS\_CKM.1 and FCS\_CKM.2 respectively
- Requirements for use of cryptographic schemes are set in FCS\_COP.1/DataEncryption, FCS\_COP.1/SigGen, FCS\_COP.1/Hash, and FCS\_COP.1/KeyedHash
- Requirements for random bit generation to support key generation and secure protocols (see SFRs resulting from T.UNTRUSTED\_COMMUNICATION\_CHANNELS) are set in FCS\_RBG\_EXT.1
- Management of cryptographic functions is specified in FMT SMF.1

## 4.1.1.3 T.UNTRUSTED COMMUNICATION CHANNELS

Threat agents may attempt to target network devices that do not use standardized secure tunnelling protocols to protect the critical network traffic. Attackers may take advantage of poorly designed protocols or poor key management to successfully perform man-in-the-middle attacks, replay attacks, etc. Successful attacks will result in loss of confidentiality and integrity of the critical network traffic, and potentially could lead to a compromise of the network device itself

#### SFR Rationale:

- The general use of secure protocols for identified communication channels is described at the top level in FTP\_ITC.1 and FTP\_TRP.1/Admin; for distributed TOEs the requirements for inter-component communications are addressed by the requirements in FPT\_ITT.1
- Requirements for the use of secure communication protocols are set for all the allowed protocols in FCS\_DTLSC\_EXT.1, FCS\_DTLSC\_EXT.2, FCS\_DTLSS\_EXT.1, FCS\_DTLSS\_EXT.2, FCS\_HTTPS\_EXT.1, FCS\_IPSEC\_EXT.1, FCS\_SSHC\_EXT.1, FCS\_SSHS\_EXT.1, FCS\_TLSC\_EXT.1, FCS\_TLSC\_EXT.1, FCS\_TLSC\_EXT.1, FCS\_TLSC\_EXT.1, FCS\_TLSC\_EXT.2
- Optional and selection-based requirements for use of public key certificates to support secure protocols are defined in FIA\_X509\_EXT.1, FIA\_X509\_EXT.2, FIA\_X509\_EXT.3

# 4.1.1.4 T.WEAK\_AUTHENTICATION\_ENDPOINTS

Threat agents may take advantage of secure protocols that use weak methods to authenticate the endpoints – e.g. a shared password that is guessable or transported as plaintext. The consequences are the same as a poorly designed protocol, the attacker could masquerade as the Administrator or another device, and the attacker could insert themselves into the network stream and perform a man-in-the-middle attack. The result is the critical network traffic is exposed and there could be a loss of confidentiality and integrity, and potentially the network device itself could be compromised.

#### SFR Rationale:

- The use of appropriate secure protocols to provide authentication of endpoints (as in the SFRs addressing T.UNTRUSTED\_COMMUNICATION\_CHANNELS) are ensured by the requirements in FTP\_ITC.1 and FTP\_TRP.1/Admin; for distributed TOEs the authentication requirements for endpoints in inter-component communications are addressed by the requirements in FPT\_ITT.1
- Additional possible special cases of secure authentication during registration of distributed TOE components are addressed by FCO\_CPC\_EXT.1 and FTP\_TRP.1/Join.

### 4.1.2 Valid Updates

Updating network device software and firmware is necessary to ensure that the security functionality of the network device is maintained. The source and content of an update to be applied must be validated by cryptographic means; otherwise, an invalid source can write their own firmware or software updates that circumvents the security functionality of the network device. Methods of validating the source and content of a software or firmware update by cryptographic means typically involve cryptographic signature schemes where hashes of the updates are digitally signed.

Unpatched versions of software or firmware leave the network device susceptible to threat agents attempting to circumvent the security functionality using known vulnerabilities. Non-validated updates or updates validated using non-secure or weak cryptography leave the updated software or firmware vulnerable to threat agents attempting to modify the software or firmware to their advantage.

#### 4.1.2.1 T.UPDATE COMPROMISE

Threat agents may attempt to provide a compromised update of the software or firmware which undermines the security functionality of the device. Non-validated updates or updates validated using non-secure or weak cryptography leave the update firmware vulnerable to surreptitious alteration.

#### SFR Rationale:

- Requirements for protection of updates are set in FPT TUD EXT.1
- Additional optional use of certificate-based protection of signatures can be specified using FPT\_TUD\_EXT.2, supported by the X.509 certificate processing requirements in FIA X509 EXT.1, FIA X509 EXT.2 and FIA X509 EXT.3
- Requirements for management of updates are defined in FMT\_SMF.1 and (for manual updates) in FMT\_MOF.1/ManualUpdate, with optional requirements for automatic updates in FMT\_MOF.1/AutoUpdate

### 4.1.3 Audited Activity

Auditing of network device activities is a valuable tool for Administrators to monitor the status of the device. It provides the means for Administrator accountability, security functionality

activity reporting, reconstruction of events, and problem analysis. Processing performed in response to device activities may give indications of a failure or compromise of the security functionality. When indications of activity that impact the security functionality are not generated and monitored, it is possible for such activities to occur without Administrator awareness. Further, if records are not generated and retained, reconstruction of the network and the ability to understand the extent of any compromise could be negatively affected. Additional concerns are the protection of the audit data that is recorded from alteration or unauthorized deletion. This could occur within the TOE, or while the audit data is in transit to an external storage device.

Note this cPP requires that the network device generate the audit data and have the capability to send the audit data to a trusted network entity (e.g., a syslog server).

### 4.1.3.1 T.UNDETECTED ACTIVITY

Threat agents may attempt to access, change, and/or modify the security functionality of the network device without Administrator awareness. This could result in the attacker finding an avenue (e.g., misconfiguration, flaw in the product) to compromise the device and the Administrator would have no knowledge that the device has been compromised.

#### SFR Rationale:

- Requirements for basic auditing capabilities are specified in FAU\_GEN.1 and FAU\_GEN.2, with timestamps provided according to FPT\_STM\_EXT.1 and if applicable, protection of NTP channels in FCS\_NTP\_EXT.1
- Requirements for protecting audit records stored on the TOE are specified in FAU STG.1
- Requirements for secure transmission of local audit records to an external IT entity via a secure channel are specified in FAU STG EXT.1
- Optional additional requirements for dealing with potential loss of locally stored audit records are specified in FAU\_STG\_EXT.2/LocSpace, and FAU\_STG.3/LocSpace
- If (optionally) configuration of the audit functionality is provided by the TOE then this is specified in FMT\_SMF.1, and confining this functionality to Security Administrators is required by FMT\_MOF.1/Functions.

## 4.1.4 Administrator and Device Credentials and Data

A network device contains data and credentials which must be securely stored and must appropriately restrict access to authorized entities. Examples include the device firmware, software, configuration authentication credentials for secure channels, and Administrator credentials. Device and Administrator keys, key material, and authentication credentials need to be protected from unauthorized disclosure and modification. Furthermore, the security functionality of the device needs to require default authentication credentials, such as Administrator passwords, be changed.

Lack of secure storage and improper handling of credentials and data, such as unencrypted credentials inside configuration files or access to secure channel session keys, can allow an

attacker to not only gain access to the network device, but also compromise the security of the network through seemingly authorized modifications to configuration or though man-in-the-middle attacks. These attacks allow an unauthorized entity to gain access and perform administrative functions using the Security Administrator's credentials and to intercept all traffic as an authorized endpoint. This results in difficulty in detection of security compromise and in reconstruction of the network, potentially allowing continued unauthorized access to Administrator and device data.

# 4.1.4.1 T.SECURITY\_FUNCTIONALITY\_COMPROMISE

Threat agents may compromise credentials and device data enabling continued access to the network device and its critical data. The compromise of credentials includes replacing existing credentials with an attacker's credentials, modifying existing credentials, or obtaining the Administrator or device credentials for use by the attacker.

#### SFR Rationale:

- Protection of secret/private keys against compromise is specified in FPT\_SKP\_EXT.1
- Secure destruction of keys is specified in FCS CKM.4
- If (optionally) management of keys is provided by the TOE then this is specified in FMT\_SMF.1, and confining this functionality to Security Administrators is required by FMT\_MTD.1/CryptoKeys
- (Protection of passwords is separately covered under T.PASSWORD CRACKING)

## 4.1.4.2 T.PASSWORD\_CRACKING

Threat agents may be able to take advantage of weak administrative passwords to gain privileged access to the device. Having privileged access to the device provides the attacker unfettered access to the network traffic and may allow them to take advantage of any trust relationships with other network devices.

#### SFR Rationale:

- Requirements for password lengths and available characters are set in FIA PMG EXT.1
- Protection of password entry by providing only obscured feedback is specified in FIA UAU.7
- Actions on reaching a threshold number of consecutive password failures are specified in FIA\_AFL.1
- Requirements for secure storage of passwords are set in FPT APW EXT.1.

#### 4.1.5 Device Failure

Security mechanisms of the network device generally build up from roots of trust to more complex sets of mechanisms. Failures could result in a compromise to the security functionality of the device. A network device self-testing its security critical components at both start-up and during run-time ensures the reliability of the device's security functionality.

### 4.1.5.1 T.SECURITY FUNCTIONALITY FAILURE

An external, unauthorized entity could make use of failed or compromised security functionality and might therefore subsequently use or abuse security functions without prior authentication to access, change or modify device data, critical network traffic or security functionality of the device.

#### SFR Rationale:

- Requirements for running self-test(s) are defined in FPT\_TST\_EXT.1
- Optional use of certificates to support self-test(s) is defined in FPT\_TST\_EXT.2 (with support for the use of certificates in FIA\_X509\_EXT.1, FIA\_X509\_EXT.2, and FIA\_X509\_EXT.3),

# 4.2 Assumptions

This section describes the assumptions made in identification of the threats and security requirements for network devices. The network device is not expected to provide assurance in any of these areas, and as a result, requirements are not included to mitigate the threats associated.

## 4.2.1 A.PHYSICAL PROTECTION

The network device is assumed to be physically protected in its operational environment and not subject to physical attacks that compromise the security and/or interfere with the device's physical interconnections and correct operation. This protection is assumed to be sufficient to protect the device and the data it contains. As a result, the cPP will not include any requirements on physical tamper protection or other physical attack mitigations. The cPP will not expect the product to defend against physical access to the device that allows unauthorized entities to extract data, bypass other controls, or otherwise manipulate the device.

[OE.PHYSICAL]

# 4.2.2 A.LIMITED\_FUNCTIONALITY

The device is assumed to provide networking functionality as its core function and not provide functionality/services that could be deemed as general purpose computing. For example, the device should not provide a computing platform for general purpose applications (unrelated to networking functionality).

[OE.NO GENERAL PURPOSE]

### 4.2.3 A.NO THRU TRAFFIC PROTECTION

A standard/generic network device does not provide any assurance regarding the protection of traffic that traverses it. The intent is for the network device to protect data that originates on or is destined to the device itself, to include administrative data and audit data. Traffic that is traversing the network device, destined for another network entity, is not covered by the ND

cPP. It is assumed that this protection will be covered by cPPs and PP-Modules for particular types of network devices (e.g., firewall).

[OE.NO\_THRU\_TRAFFIC\_PROTECTION]

### 4.2.4 A.TRUSTED ADMINISTRATOR

The Security Administrator(s) for the network device are assumed to be trusted and to act in the best interest of security for the organization. This includes being appropriately trained, following policy, and adhering to guidance documentation. Administrators are trusted to ensure passwords/credentials have sufficient strength and entropy and to lack malicious intent when administering the device. The network device is not expected to be capable of defending against a malicious Administrator that actively works to bypass or compromise the security of the device.

For TOEs supporting X.509v3 certificate-based authentication, the Security Administrator(s) are expected to fully validate (e.g. offline verification) any CA certificate (root CA certificate or intermediate CA certificate) loaded into the TOE's trust store (aka 'root store', ' trusted CA Key Store', or similar) as a trust anchor prior to use (e.g. offline verification).

[OE.TRUSTED\_ADMIN]

## 4.2.5 A.REGULAR UPDATES

The network device firmware and software is assumed to be updated by an Administrator on a regular basis in response to the release of product updates due to known vulnerabilities.

[OE.UPDATES]

### 4.2.6 A.ADMIN CREDENTIALS SECURE

The Administrator's credentials (private key) used to access the network device are protected by the platform on which they reside.

[OE.ADMIN\_CREDENTIALS\_SECURE]

### 4.2.7 A.COMPONENTS RUNNING (applies to distributed TOEs only)

For distributed TOEs it is assumed that the availability of all TOE components is checked as appropriate to reduce the risk of an undetected attack on (or failure of) one or more TOE components. It is also assumed that in addition to the availability of all components it is also checked as appropriate that the audit functionality is running properly on all TOE components.

[OE.COMPONENTS\_RUNNING]

### 4.2.8 A.RESIDUAL\_INFORMATION

The Administrator must ensure that there is no unauthorized access possible for sensitive residual information (e.g. cryptographic keys, keying material, PINs, passwords etc.) on networking equipment when the equipment is discarded or removed from its operational environment.

# [OE.RESIDUAL INFORMATION]

# 4.3 Organizational Security Policy

An organizational security policy is a set of rules, practices, and procedures imposed by an organization to address its security needs. The description of each policy is then followed by a rationale describing how it is addressed by the SFRs in section 6, appendix A, and appendix B.

# 4.3.1 P.ACCESS\_BANNER

The TOE shall display an initial banner describing restrictions of use, legal agreements, or any other appropriate information to which users consent by accessing the TOE.

#### SFR Rationale:

 An advisory notice and consent warning message is required to be displayed by FTA TAB.1

## 5. Security Objectives

## 5.1 Security Objectives for the Operational Environment

The following subsections describe objectives for the Operational Environment.

#### 5.1.1 OE.PHYSICAL

Physical security, commensurate with the value of the TOE and the data it contains, is provided by the environment.

## 5.1.2 OE.NO GENERAL PURPOSE

There are no general-purpose computing capabilities (e.g., compilers or user applications) available on the TOE, other than those services necessary for the operation, administration and support of the TOE.

## 5.1.3 OE.NO THRU TRAFFIC PROTECTION

The TOE does not provide any protection of traffic that traverses it. It is assumed that protection of this traffic will be covered by other security and assurance measures in the operational environment.

## 5.1.4 OE.TRUSTED\_ADMIN

Security Administrators are trusted to follow and apply all guidance documentation in a trusted manner.

For TOEs supporting X.509v3 certificate-based authentication, the Security Administrator(s) are assumed to monitor the revocation status of all certificates in the TOE's trust store and to remove any certificate from the TOE's trust store in case such certificate can no longer be trusted

#### 5.1.5 OE.UPDATES

The TOE firmware and software is updated by an Administrator on a regular basis in response to the release of product updates due to known vulnerabilities.

## 5.1.6 OE.ADMIN\_CREDENTIALS\_SECURE

The Administrator's credentials (private key) used to access the TOE must be protected on any other platform on which they reside.

## 5.1.7 OE.COMPONENTS\_RUNNING (applies to distributed TOEs only)

For distributed TOEs the Security Administrator ensures that the availability of every TOE component is checked as appropriate to reduce the risk of an undetected attack on (or failure of) one or more TOE components. The Security Administrator also ensures that it is checked as appropriate for every TOE component that the audit functionality is running properly.

## 5.1.8 OE.RESIDUAL\_INFORMATION

The Security Administrator ensures that there is no unauthorized access possible for sensitive residual information (e.g. cryptographic keys, keying material, PINs, passwords etc.) on networking equipment when the equipment is discarded or removed from its operational environment.

## 6. Security Functional Requirements

The individual security functional requirements are specified in the sections below. SFRs in this section are mandatory SFRs that any conformant TOE must meet. Based on selections made in these SFRs it will also be necessary to include some of the selection-based SFRs in Appendix B. Additional optional SFRs may also be adopted from those listed in Appendix A.

For a distributed TOE, the ST author should reference Table 1 for guidance on how each SFR should be met. The table details whether SFRs should be met by all TOE components, by at least one TOE component or whether they are dependent upon the feature being implemented by the TOE component. The ST for a distributed TOE must include a mapping of SFRs to each of the components of the TOE. (Note that this deliverable is examined as part of the ASE\_TSS.1 and AVA\_VAN.1 Evaluation Activities as described in [SD, 5.1.2] and [SD, 5.6.1.1] respectively.

The Evaluation Activities defined in [SD] describe actions that the evaluator will take in order to determine compliance of a particular TOE with the SFRs. The content of these Evaluation Activities will therefore provide more insight into deliverables required from TOE Developers.

#### 6.1 Conventions

The conventions used in descriptions of the SFRs are as follows:

- Unaltered SFRs are stated in the form used in [CC2] or their extended component definition (ECD);
- Refinement made in the PP: the refinement text is indicated with **bold text** and strikethroughs;
- Selection wholly or partially completed in the PP: the selection values (i.e. the selection values adopted in the PP or the remaining selection values available for the ST) are indicated with <u>underlined text</u>
  - e.g. "[selection: *disclosure, modification, loss of use*]" in [CC2] or an ECD might become "<u>disclosure</u>" (completion) or "[selection: <u>disclosure, modification</u>]" (partial completion) in the PP;
- Assignment wholly or partially completed in the PP: indicated with *italicized text*;
- Assignment completed within a selection in the PP: the completed assignment text is indicated with *italicized and underlined text* 
  - e.g. "[selection: change\_default, query, modify, delete, [assignment: other operations]]" in [CC2] or an ECD might become "change\_default, select\_tag" (completion of both selection and assignment) or "[selection: change\_default, select\_tag, select\_value]" (partial completion of selection, and completion of assignment) in the PP;
- Iteration: indicated by adding a string starting with "/" (e.g. "FCS COP.1/Hash").

Extended SFRs are identified by having a label "EXT" at the end of the SFR name.

Where compliance to RFCs is referred to in SFRs, this is intended to be demonstrated by completing the corresponding evaluation activities in [SD] for the relevant SFR.

#### **6.2** SFR Architecture

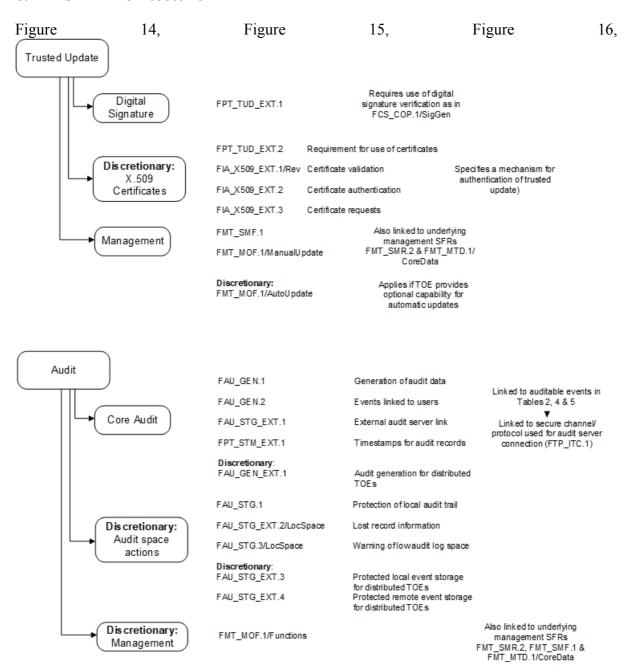

Figure 17, Figure 18 and Figure 19 give a graphical presentation of the connections between the Security Functional Requirements in sections 6.3-6.9, Appendix A and Appendix B, and the underlying functional areas and operations that the TOE provides. The diagrams provide a

context for SFRs that relates to their use in the TOE, whereas other sections define the SFRs grouped by the abstract class and family groupings in [CC2].

In the diagrams, the SFRs from Appendix B are both described as "Discretionary", meaning that their inclusion in an ST will depend on the particular properties of a product. The SFRs from Appendix B that are required by an ST are determined by the selections made in other SFRs. For example: FTP\_ITC.1 and FTP\_TRP.1/Admin (in sections 6.9.1.1 and 6.9.2.1 respectively) each contain selections of a protocol to be used for the type of secure channel described by the SFR. The selection of the protocol(s) here determines which of the protocol-specific SFRs in section B.3.1 are also required in the ST. SFRs in Appendix A can be included in the ST if they are provided by the TOE, but are not mandatory in order for a TOE to claim conformance to this cPP.

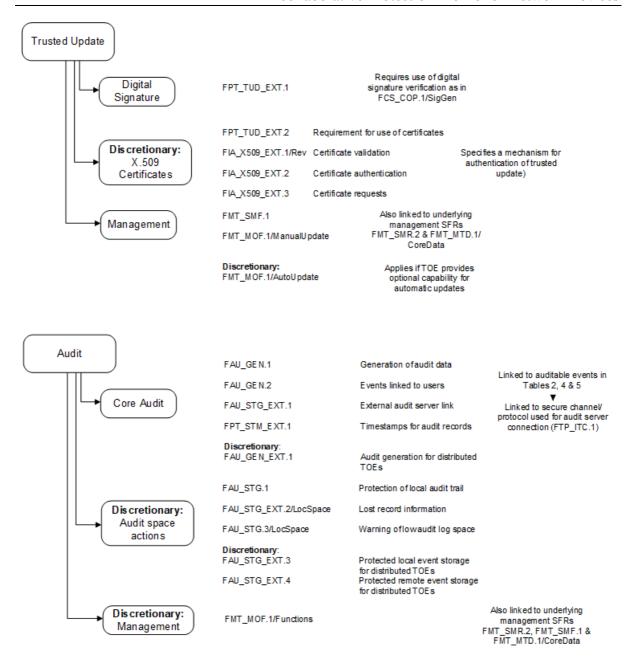

Figure 17: Trusted Update and Audit SFR Architecture

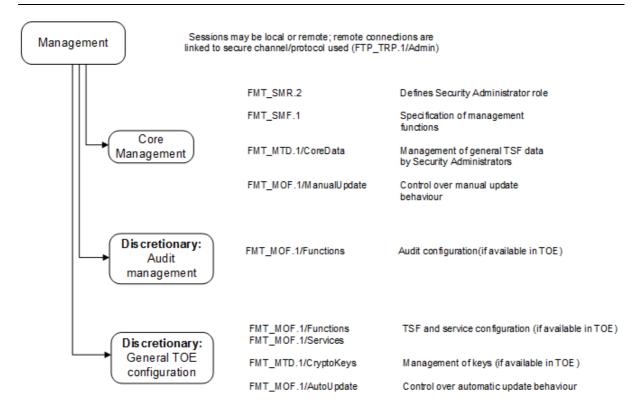

Figure 18: Management SFR Architecture

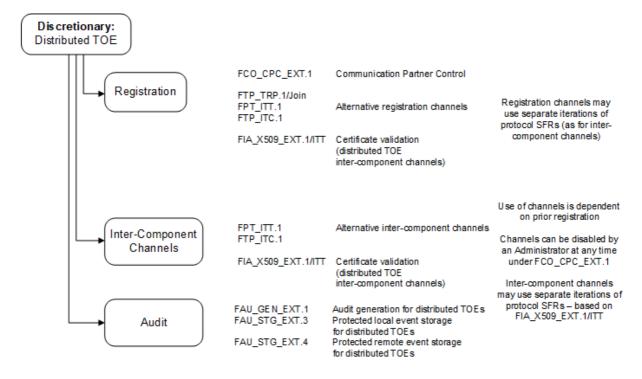

Figure 19: Distributed TOE SFR Architecture

## 6.3 Security Audit (FAU)

## **6.3.1** Security Audit Data generation (FAU\_GEN)

In order to assure that information exists that allows Security Administrators to discover intentional and unintentional issues with the configuration and/or operation of the system, compliant TOEs have the capability of generating audit data targeted at detecting such activity. Auditing of administrative activities provides information that may be used to hasten corrective action should the system be configured incorrectly. Audit of select system events can provide an indication of failure of critical portions of the TOE (e.g. a cryptographic provider process not running) or anomalous activity (e.g. establishment of an administrative session at a suspicious time, repeated failures to establish sessions or authenticate to the system) of a suspicious nature.

In some instances, there may be a large amount of audit information produced that could overwhelm the TOE or Administrators in charge of reviewing the audit information. The TOE must be capable of sending audit information to an external trusted entity. This information must carry reliable timestamps, which will help order the information when sent to the external device.

Loss of communication with the audit server is problematic. While there are several potential mitigations to this threat, this cPP does not mandate that a specific action takes place; the degree to which this action preserves the audit information and still allows the TOE to meet its functionality responsibilities should drive decisions on the suitability of the TOE in a particular environment.

## 6.3.1.1 FAU\_GEN.1 Audit data generation

#### FAU GEN.1

#### **Audit Data Generation**

**FAU\_GEN.1.1** The TSF shall be able to generate an audit record of the following auditable events:

- a) Start-up and shut-down of the audit functions;
- b) All auditable events for the not specified level of audit; and
- c) All administrative actions comprising:
  - Administrative login and logout (name of user account shall be logged if individual user accounts are required for Administrators).
  - Changes to TSF data related to configuration changes (in addition to the information that a change occurred it shall be logged what has been changed).
  - Generating/import of, changing, or deleting of cryptographic keys (in addition to the action itself a unique key name or key reference shall be logged).
  - Resetting passwords (name of related user account shall be logged).
  - [selection: no other actions, [assignment: [list of other uses of privileges]]];
- d) Specifically defined auditable events listed in Table 2.

If the list of "administrative actions" appears to be incomplete, the assignment in the selection should be used to list additional administrative actions which are audited.

The requirement to audit the "Generating/import of, changing, or deleting of cryptographic keys" refers to all types of cryptographic keys which are intended to be used longer than for just one session (i.e. it does not refer to ephemeral keys/session keys). The requirement applies to all named changes independently from how they are invoked. A cryptographic key could e.g. be generated automatically during initial start-up without administrator intervention or through administrator intervention. This requirement also applies to the management of cryptographic keys by adding, replacing or removing trust anchors in the TOE's trust store. In all related cases the changes to cryptographic keys need to be audited together with a unique key name, key reference or unique identifier for the corresponding certificate.

The ST author replaces the cross-reference to the table of audit events with an appropriate cross-reference for the ST. This must also include the relevant parts of Table 4 and Table 5 for optional and selection-based SFRs included in the ST.

For distributed TOEs each component must generate an audit record for each of the SFRs that it implements. If more than one TOE component is involved when an audit event is triggered, the event has to be audited on each component (e.g. rejection of a connection by one component while attempting to establish a secure communication channel between two components should result in an audit event being generated by both components). This is not limited to error cases but also includes events about successful actions like successful build up/tear down of a secure communication channel between TOE components.

## Application Note 2

The ST author can include other auditable events directly in the table; they are not limited to the list presented.

For the audit events that shall be generated by the TOE FMT\_SMF.1 in particular is highly dependent on the selected options. Therefore there is only a very generic requirement specified in Table 2 for FMT\_SMF.1 ('All management activities of TSF data.'). If, for example, "Ability to start and stop services" is selected for FMT\_SMF.1, any start and stop of a service by a Security Administrator shall be audited. Or if, for example, "Ability to enable or disable automatic checking for updates or automatic updates" is selected for FMT\_SMF.1 all events of enabling or disabling automatic checking for updates or automatic updates shall be audited.

With respect to FAU\_GEN.1.1, FMT\_SMF.1 and FMT\_MOF.1/Services the term "services" refers to trusted path and trusted channel communications, on demand self-tests, trusted update and Administrator sessions (that exist under the trusted path) (e.g. netconf).

FAU\_GEN.1.2 The TSF shall record within each audit record at least the following information:

a) Date and time of the event, type of event, subject identity, and the outcome (success or failure) of the event; and

b) For each audit event type, based on the auditable event definitions of the functional components included in the cPP/ST, *information specified in column three of Table 2*.

## Application Note 3

The ST author replaces the cross-reference to the table of audit events with an appropriate cross-reference for the ST. This must also include the relevant parts of Table 4 and Table 5 for optional and selection-based SFRs included in the ST.

Table 2: Security Functional Requirements and Auditable Events

Additional audit events will apply to the TOE depending on the optional and selection-based requirements adopted from Appendix A and Appendix B. The ST author must therefore include the relevant additional events specified in the tables in Table 4 and Table 5.

#### 6.3.1.2 FAU GEN.2 User identity association

#### **FAU GEN.2**

## User identity association

**FAU\_GEN.2.1** For audit events resulting from actions of identified users, the TSF shall be able to associate each auditable event with the identity of the user that caused the event.

## Application Note 5

Where an auditable event is triggered by another component, the component that records the event must associate the event with the identity of the initiating component that caused the event (applies to distributed TOEs only).

## 6.3.2 Security audit event storage (Extended – FAU STG EXT)

A network device TOE is not expected to take responsibility for all audit storage itself. Although it is required to store data locally at the time of generation, and to take some appropriate action if this local storage capacity is exceeded, the TOE is also required to be able to establish a secure link to an external audit server to enable external audit trail storage.

#### 6.3.2.1 FAU STG EXT.1 Protected Audit Event Storage

#### **FAU STG EXT.1**

## **Protected Audit Event Storage**

**FAU\_STG\_EXT.1.1** The TSF shall be able to transmit the generated audit data to an external IT entity using a trusted channel according to FTP ITC.1.

#### Application Note 6

For selecting the option of transmission of generated audit data to an external IT entity the TOE relies on a non-TOE audit server for storage and review of audit records. The storage of these audit records and the ability to allow the Administrator to review these audit records is provided by the operational environment in that case. Since the external audit server is not part of the TOE, there are no requirements on it except the capabilities for FTP\_ITC.1 transport for audit data. No requirements are placed upon the format or underlying protocol of the audit data being transferred. The TOE must be capable of being configured to transfer audit data to an external IT entity without Administrator intervention. Manual transfer would not meet the requirements. Transmission could be done in real-time or periodically. If the transmission is not done in real-time then the TSS describes what event stimulates the transmission to be made and what range of frequencies the TOE supports for making transfers of audit data to the audit server; the TSS also suggests typical acceptable frequencies for the transfer.

For distributed TOEs each component must be able to export audit data across a protected channel external (FTP\_ITC.1) or intercomponent (FPT\_ITT.1 or FTP\_ITC.1) as appropriate. At least one component of the TOE must be able to export audit records via FTP\_ITC.1 such that all TOE audit records can be exported to an external IT entity.

**FAU\_STG\_EXT.1.2** The TSF shall be able to store generated audit data on the TOE itself. [selection:

- *TOE shall consist of a single standalone component that stores audit data locally,*
- The TOE shall be a distributed TOE that stores audit data on the following TOE components: [assignment: identification of TOE components],
- The TOE shall be a distributed TOE with storage of audit data provided externally for the following TOE components: [assignment: list of TOE components that do not store audit data locally and the other TOE components to which they transmit their generated audit data].

If the TOE is a standalone TOE (i.e. not a distributed TOE) the option 'The TOE shall consist of a single standalone component that stores audit data locally' shall be selected.

If the TOE is a distributed TOE the option 'The TOE shall be a distributed TOE that stores audit data on the following TOE components: [assignment: identification of TOE components]' shall be selected and the TOE components which store audit data locally shall be listed in the assignment. Since all TOEs are required to provide functions to store audit data locally this option needs to be selected for all distributed TOEs. In addition, FAU\_GEN\_EXT.1 and FAU\_STG\_EXT.3 shall be claimed in the ST. If the distributed TOE consists only of components which are storing audit data locally, it is sufficient to select only the option 'The TOE shall be a distributed TOE that stores audit data on the following TOE components: [assignment: identification of TOE components]' and add FAU\_GEN\_EXT.1 and FAU\_STG\_EXT.3.

If the TOE is a distributed TOE and some TOE components are not storing audit data locally, the option 'The TOE shall be a distributed TOE with storage of audit data provided externally for the following TOE components: [assignment: list of TOE components that do not store audit data locally and the other TOE components to which they transmit their generated audit data]' shall be selected in addition to the option 'The TOE shall be a distributed TOE that stores audit data on the following TOE components: [assignment: identification of TOE components]'. In that case FAU\_STG\_EXT.4 shall be claimed in the ST in addition to FAU\_GEN\_EXT.1 and FAU\_STG\_EXT.3. For the option 'The TOE shall be a distributed TOE with storage of audit data provided externally for the following TOE components: [assignment: list of TOE components that do not store audit data locally and the other TOE components to which they transmit their generated audit data]' the TOE components that to not store audit data locally shall be mapped to the TOE components to which they transmit their generated audit data.

For distributed TOEs this SFR can be fulfilled either by every TOE component storing its own security audit data locally or by one or more TOE components storing audit data locally and other TOE components which are not storing audit information locally sending security audit data to other TOE components for local storage. For the transfer of security audit data between TOE components a protected channel according to FTP\_ITC.1 or FPT\_ITT.1 shall be used. The TSS shall describe which TOE components store security audit data locally and which TOE components do not store security audit data locally. For the latter, the TSS shall describe at which other TOE component the audit data is stored locally.

**FAU\_STG\_EXT.1.3** The TSF shall [selection: drop new audit data, overwrite previous audit records according to the following rule: [assignment: rule for overwriting previous audit records], [assignment: other action]] when the local storage space for audit data is full.

The external log server might be used as alternative storage space in case the local storage space is full. The "other action" could in this case be defined as "send the new audit data to an external IT entity".

For distributed TOEs each component is not required to store generated audit data locally but the overall TOE needs to be able to store audit data locally. Each component must at least provide the ability to temporarily buffer audit information locally to ensure that audit records are preserved in case of network connectivity issues. Buffering audit information locally, does not necessarily involve non-volatile memory: audit information could be buffered in volatile memory. However, the local storage of audit information in the sense of FAU\_STG\_EXT.1.3 needs to be done in non-volatile memory. For every component which performs local storage of audit information, the behaviour when local storage is exhausted needs to be described. For every component which is buffering audit information instead of storing audit information locally itself, it needs to be described what happens in case the buffer space is exhausted.

## 6.4 Cryptographic Support (FCS)

This section defines cryptographic requirements that underlie the other security properties of the TOE, covering key generation and random bit generation, key establishment methods, key destruction, and the various types of cryptographic operation to provide AES encryption/decryption, signature verification, hash generation, and keyed hash generation.

These SFRs support the implementation of the selection-based protocol-level SFRs in Appendix B.

## 6.4.1 Cryptographic Key Management (FCS CKM)

#### 6.4.1.1 FCS CKM.1 Cryptographic Key Generation (Refinement)

## FCS\_CKM.1

#### **Cryptographic Key Generation**

**FCS\_CKM.1.1** The TSF shall generate **asymmetric** cryptographic keys in accordance with a specified cryptographic key generation algorithm: *[selection:* 

- RSA schemes using cryptographic key sizes of 2048-bit or greater that meet the following: FIPS PUB 186-4, "Digital Signature Standard (DSS)", Appendix B.3;
- ECC schemes using "NIST curves" [selection: P-256, P-384, P-521] that meet the following: FIPS PUB 186-4, "Digital Signature Standard (DSS)", Appendix B.4;
- FFC schemes using cryptographic key sizes of 2048-bit or greater that meet the following: FIPS PUB 186-4, "Digital Signature Standard (DSS)", Appendix B.1

FFC Schemes using Diffie-Hellman group 14 that meet the following: RFC 3526, Section 3

] and specified cryptographic key sizes [assignment: cryptographic key sizes] that meet the following: [assignment: list of standards].

## **Application Note 9**

The ST author selects all key generation schemes used for key establishment and device authentication. When key generation is used for key establishment, the schemes in FCS\_CKM.2.1 and selected cryptographic protocols must match the selection. When key generation is used for device authentication, other than ssh-rsa, ecdsa-sha2-nistp256, ecdsa-sha2-nistp384 and ecdsa-sha2-nistp521, the public key is expected to be associated with an X.509v3 certificate.

If the TOE acts as a receiver in the key establishment schemes and is not configured to support mutual authentication, the TOE does not need to implement key generation.

In a distributed TOE, if the TOE component acts as a receiver in the key establishment scheme, the TOE does not need to implement key generation.

## 6.4.1.2 FCS CKM.2 Cryptographic Key Establishment (Refinement)

#### FCS CKM.2

#### Cryptographic Key Establishment

FCS\_CKM.2.1 The TSF shall perform cryptographic key establishment in accordance with a specified cryptographic key establishment method: [selection:

- RSA-based key establishment schemes that meet the following: NIST Special Publication 800-56B Revision 1, "Recommendation for Pair-Wise Key Establishment Schemes Using Integer Factorization Cryptography";
- Elliptic curve-based key establishment schemes that meet the following: NIST Special Publication 800-56A Revision 2, "Recommendation for Pair-Wise Key Establishment Schemes Using Discrete Logarithm Cryptography";
- Finite field-based key establishment schemes that meet the following: NIST Special Publication 800-56A Revision 2, "Recommendation for Pair-Wise Key Establishment Schemes Using Discrete Logarithm Cryptography";
- <u>Key establishment scheme using Diffie-Hellman group 14 that meets the following:</u> <u>RFC 3526, Section 3;</u>

that meets the following: [assignment: list of standards].

## Application Note 10

This is a refinement of the SFR FCS\_CKM.2 to deal with key establishment rather than key distribution.

The ST author selects all key establishment schemes used for the selected cryptographic protocols. For Diffie-Hellman group 14, ST authors should make the corresponding selection from the SFR instead of using the Finite field-based key establishment selection.

The RSA-based key establishment schemes are described in Section 9 of NIST SP 800-56B **Revision 1**; however, Section 9 relies on implementation of other sections in SP 800-56B **Revision 1**.

The elliptic curves used for the key establishment scheme correlate with the curves specified in FCS CKM.1.1.

The domain parameters used for the finite field-based key establishment scheme are specified by the key generation according to FCS\_CKM.1.1.

## 6.4.1.3 FCS CKM.4 Cryptographic Key Destruction

#### FCS CKM.4

## **Cryptographic Key Destruction**

FCS\_CKM.4.1 The TSF shall destroy cryptographic keys in accordance with a specified cryptographic key destruction method

- For plaintext keys in volatile storage, the destruction shall be executed by a [selection: single overwrite consisting of [selection: a pseudo-random pattern using the TSF's RBG, zeroes, ones, a new value of the key, [assignment: a static or dynamic value that does not contain any CSP]], destruction of reference to the key directly followed by a request for garbage collection];
- For plaintext keys in non-volatile storage, the destruction shall be executed by the invocation of an interface provided by a part of the TSF that [selection:
  - o logically addresses the storage location of the key and performs a [selection: single, [assignment: number of passes]-pass] overwrite consisting of [selection: a pseudorandom pattern using the TSF's RBG, zeroes, ones, a new value of the key, [assignment: a static or dynamic value that does not contain any CSP]];
  - o instructs a part of the TSF to destroy the abstraction that represents the key]

that meets the following: *No Standard*.

### Application Note 11

In parts of the selections where keys are identified as being destroyed by "a part of the TSF", the TSS identifies the relevant part and the interface involved. The interface referenced in the requirement could take different forms for different TOEs, the most likely of which is an application programming interface to an OS kernel. There may be various levels of abstraction visible. For instance, in a given implementation the application may have access to the file system details and may be able to logically address specific memory locations. In another implementation the application may simply have a handle to a resource and can only ask another part of the TSF such as the interpreter or OS to delete the resource.

Where different key destruction methods are used for different keys and/or different destruction situations then the different methods and the keys/situations they apply to are described in the

TSS (and the ST may use separate iterations of the SFR to aid clarity). The TSS describes all relevant keys used in the implementation of SFRs, including cases where the keys are stored in a non-plaintext form. In the case of non-plaintext storage, the encryption method and relevant key-encrypting-key are identified in the TSS.

Some selections allow assignment of "a value that does not contain any CSP". This means that the TOE uses some specified data not drawn from an RBG meeting FCS\_RBG\_EXT requirements, and not being any of the particular values listed as other selection options. The point of the phrase "does not contain any CSP" is to ensure that the overwritten data is carefully selected, and not taken from a general pool that might contain current or residual data that itself requires confidentiality protection.

For the avoidance of doubt: the "cryptographic keys" in this SFR include session keys. Key destruction does not apply to the public component of asymmetric key pairs.

## 6.4.2 Cryptographic Operation (FCS COP)

## 6.4.2.1 FCS\_COP.1 Cryptographic Operation

FCS_COP.1/DataEncryption	Cryptographic	Operation	(AES	Data	Encryption/
	Decryption)				

FCS\_COP.1.1/DataEncryption The TSF shall perform encryption/decryption in accordance with a specified cryptographic algorithm AES used in [selection: CBC, CTR, GCM] mode and cryptographic key sizes [selection: 128 bits, 192 bits, 256 bits] that meet the following: AES as specified in ISO 18033-3, [selection: CBC as specified in ISO 10116, CTR as specified in ISO 10116, GCM as specified in ISO 19772].

## **Application Note 12**

For the first selection of FCS\_COP.1.1/DataEncryption, the ST author chooses the mode or modes in which AES operates. For the second selection, the ST author chooses the key sizes that are supported by this functionality. The modes and key sizes selected here correspond to the cipher suite selections made in the trusted channel requirements.

FCS_COP.1/SigGen	Cryptographic Operation (Signature Generation and
	Verification)

FCS\_COP.1.1/SigGen The TSF shall perform *cryptographic signature services* (generation and verification) in accordance with a specified cryptographic algorithm [selection:

- RSA Digital Signature Algorithm and cryptographic key sizes (modulus) [assignment: 2048 bits or greater],
- Elliptic Curve Digital Signature Algorithm and cryptographic key sizes [assignment: 256 bits or greater]

 $\int$ 

that meet the following: [selection:

- For RSA schemes: FIPS PUB 186-4, "Digital Signature Standard (DSS)", Section 5.5, using PKCS #1 v2.1 Signature Schemes RSASSA-PSS and/or RSASSA-PKCS1v1\_5; ISO/IEC 9796-2, Digital signature scheme 2 or Digital Signature scheme 3,
- For ECDSA schemes: FIPS PUB 186-4, "Digital Signature Standard (DSS)", Section 6 and Appendix D, Implementing "NIST curves" [selection: P-256, P-384, P-521]; ISO/IEC 14888-3, Section 6.4

].

#### **Application Note 13**

The ST Author chooses the algorithm(s) implemented to perform digital signatures. For the algorithm(s) chosen, the ST author makes the appropriate assignments/selections to specify the parameters that are implemented for that algorithm. The ST author ensures that the assignments and selections for this SFR include all the parameter values necessary for the cipher suites selected for the protocol SFRs (see Appendix B.3.1) that are included in the ST. The ST Author checks for consistency of selections with other FCS requirements, especially when supporting elliptic curves.

## FCS COP.1/Hash

## **Cryptographic Operation (Hash Algorithm)**

FCS\_COP.1.1/Hash The TSF shall perform *cryptographic hashing services* in accordance with a specified cryptographic algorithm [selection: SHA-1, SHA-256, SHA-384, SHA-512] and cryptographic key sizes [assignment: cryptographic key sizes] and message digest sizes [selection: 160, 256, 384, 512] bits that meet the following: ISO/IEC 10118-3:2004.

#### Application Note 14

Vendors are strongly encouraged to implement updated protocols that support the SHA-2 family; until updated protocols are supported, this cPP allows support for SHA-1 implementations in compliance with SP 800-131A. In a future version of this cPP, SHA-256 will be the minimum requirement for all TOEs.

The hash selection should be consistent with the overall strength of the algorithm used for FCS\_COP.1/DataEncryption and FCS\_COP.1/SigGen (for example, SHA 256 for 128-bit keys).

## FCS COP.1/KeyedHash

## **Cryptographic Operation (Keyed Hash Algorithm)**

FCS\_COP.1.1/KeyedHash The TSF shall perform *keyed-hash message authentication* in accordance with a specified cryptographic algorithm [selection: HMAC-SHA-1, HMAC-SHA-256, HMAC-SHA-384, HMAC-SHA-512] and cryptographic key sizes [assignment: key size (in bits) used in HMAC] and message digest sizes [selection: 160, 256, 384, 512] bits that meet the following: ISO/IEC 9797-2:2011, Section 7 "MAC Algorithm 2".

The key size [k] in the assignment falls into a range between L1 and L2 (defined in ISO/IEC 10118 for the appropriate hash function). For example, for SHA-256, L1=512, L2=256, where L2 <= k <= L1.

#### 6.4.3 Random Bit Generation (Extended – FCS RBG EXT)

## 6.4.3.1 FCS RBG EXT.1 Random Bit Generation

## FCS RBG EXT.1

#### **Random Bit Generation**

**FCS\_RBG\_EXT.1.1** The TSF shall perform all deterministic random bit generation services in accordance with ISO/IEC 18031:2011 using [selection: *Hash\_DRBG (any), HMAC\_DRBG (any), CTR\_DRBG (AES)*].

**FCS\_RBG\_EXT.1.2** The deterministic RBG shall be seeded by at least one entropy source that accumulates entropy from [selection: [assignment: number of software-based sources] software-based noise source, [assignment: number of hardware-based sources] hardware-based noise source] with a minimum of [selection: 128 bits, 192 bits, 256 bits] of entropy at least equal to the greatest security strength, according to ISO/IEC 18031:2011 Table C.1 "Security Strength Table for Hash Functions", of the keys and hashes that it will generate.

## Application Note 16

For the first selection in FCS\_RBG\_EXT.1.2, the ST author selects at least one of the types of noise sources. If the TOE contains multiple noise sources of the same type, the ST author fills the assignment with the appropriate number for each type of source (e.g., 2 software-based noise sources, 1 hardware-based noise source). The documentation and tests required in the Evaluation Activity for this element should be repeated to cover each source indicated in the ST.

ISO/IEC 18031:2011 contains three different methods of generating random numbers; each of these, in turn, depends on underlying cryptographic primitives (hash functions/ciphers). The ST author will select the function used and include the specific underlying cryptographic primitives used in the requirement. While any of the identified hash functions (SHA-1, SHA-256, SHA-384, SHA-512) are allowed for Hash\_DRBG or HMAC\_DRBG, only AES-based implementations for CTR\_DRBG are allowed.

If the key length for the AES implementation used here is different than that used to encrypt the user data, then FCS\_COP.1 may have to be adjusted or iterated to reflect the different key length. For the selection in FCS\_RBG\_EXT.1.2, the ST author selects the minimum number of bits of entropy that is used to seed the RBG, which must be equal or greater than the security strength of any key generated by the TOE.

## 6.5 Identification and Authentication (FIA)

In order to provide a trusted means for Administrators to interact with the TOE, the TOE provides a password-based logon mechanism. The Administrator must have the capability to

compose a strong password, and have mechanisms in place so that the password must be changed regularly. To avoid attacks where an attacker might observe a password being typed by an Administrator, passwords must be obscured during logon. Session locking or termination must also be implemented to mitigate the risk of an account being used illegitimately. Passwords must be stored in an obscured form, and there must be no interface provided for specifically reading the password or password file such that the passwords are displayed in plain text.

# 6.5.1.1 Authentication Failure Management (FIA\_AFL)FIA\_AFL.1 Authentication Failure Management (Refinement)

## FIA AFL.1 Authentication Failure Management

**FIA\_AFL.1.1** The TSF shall detect when <u>an Administrator configurable positive integer</u> within [assignment: *range of acceptable values*] unsuccessful authentication attempts occur related to *Administrators attempting to authenticate remotely*.

FIA\_AFL.1.2 When the defined number of unsuccessful authentication attempts has been met, the TSF shall [selection: prevent the offending remote Administrator from successfully authenticating until [assignment: action] is taken by a local Administrator; prevent the offending remote Administrator from successfully authenticating until an Administrator defined time period has elapsed].

## Application Note 17

This requirement applies to a defined number of successive unsuccessful authentication attempts and does not apply to an Administrator at the local console, since it does not make sense to lock a local Administrator's account in this fashion. This could be addressed by (for example) requiring a separate account for local Administrators or having the authentication mechanism implementation distinguish local and remote login attempts. The "action" taken by a local Administrator is implementation specific and would be defined in the Administrator guidance (for example, lockout reset or password reset). The ST author chooses one of the selections for handling of authentication failures depending on how the TOE has implemented this handler.

The TSS describes how the TOE ensures that authentication failures by remote Administrators cannot lead to a situation where no Administrator access is available, either permanently or temporarily (e.g. by providing local logon which is not subject to blocking). The Operational Guidance describes, and identifies the importance of, any actions that are required in order to ensure that Administrator access will always be maintained, even if remote administration is made permanently or temporarily unavailable due to blocking of accounts as a result of FIA\_AFL.1.

## 6.5.2 Password Management (Extended – FIA PMG EXT)

## 6.5.2.1 FIA PMG EXT.1 Password Management

## FIA\_PMG\_EXT.1 Password Management

**FIA\_PMG\_EXT.1.1** The TSF shall provide the following password management capabilities for administrative passwords:

- a) Passwords shall be able to be composed of any combination of upper and lower case letters, numbers, and the following special characters: [selection: "!", "@", "#", "\$", "%", "%", "&", "\*", "(", ")", [assignment: other characters]];
- b) Minimum password length shall be configurable to between [assignment: minimum number of characters supported by the TOE] and [assignment: number of characters greater than or equal to 15] characters.

## **Application Note 18**

The ST author selects the special characters that are supported by the TOE. They may optionally list additional special characters supported using the assignment. "Administrative passwords" refers to passwords used by Administrators at the local console, over protocols that support passwords, such as SSH and HTTPS, or to grant configuration data that supports other SFRs in the Security Target.

The second assignment should be configured with the largest minimum password length the Security Administrator can configure.

#### 6.5.3 User Identification and Authentication (Extended – FIA UIA EXT)

#### 6.5.3.1 FIA UIA EXT.1 User Identification and Authentication

#### FIA UIA EXT.1 User Identification and Authentication

**FIA\_UIA\_EXT.1.1** The TSF shall allow the following actions prior to requiring the non-TOE entity to initiate the identification and authentication process:

- Display the warning banner in accordance with FTA TAB.1;
- [selection: no other actions, automated generation of cryptographic keys, [assignment: list of services, actions performed by the TSF in response to non-TOE requests].

**FIA\_UIA\_EXT.1.2** The TSF shall require each administrative user to be successfully identified and authenticated before allowing any other TSF-mediated actions on behalf of that administrative user.

This requirement applies to users (Administrators and external IT entities) of services available from the TOE directly, and not services available by connecting through the TOE. While it should be the case that few or no services are available to external entities prior to identification and authentication, if there are some available (perhaps ICMP echo) these should be listed in the assignment statement; if automated generation of cryptographic keys is supported without administrator authentication, the option "automated generation of cryptographic keys" should be selected; otherwise "no other actions" should be selected.

Authentication can be password-based through the local console or through a protocol that supports passwords (such as SSH), or be certificate based (such as SSH, TLS).

For communications with external IT entities (an audit server, for instance), such connections must be performed in accordance with FTP\_ITC.1, whose protocols perform identification and authentication. This means that such communications (e.g., establishing the IPsec connection to the authentication server) would not have to be specified in the assignment, since establishing the connection "counts" as initiating the identification and authentication process.

According to the application note for FMT\_SMR.2, for distributed TOEs at least one TOE component has to support the authentication of Security Administrators according to FIA\_UIA\_EXT.1 and FIA\_UAU\_EXT.2 but not necessarily all TOE components. In case not all TOE components support this way of authentication for Security Administrators the TSS shall describe how Security Administrators are authenticated and identified.

#### 6.5.4 User authentication (FIA UAU) (Extended – FIA UAU EXT)

#### 6.5.4.1 FIA UAU EXT.2 Password-based Authentication Mechanism

## FIA UAU EXT.2 Password-based Authentication Mechanism

**FIA\_UAU\_EXT.2.1** The TSF shall provide a local password-based authentication mechanism, and [selection: [assignment: other authentication mechanism(s)], no other authentication mechanism] to perform local administrative user authentication.

#### **Application Note 20**

The assignment should be used to identify any additional local authentication mechanisms supported. Local authentication mechanisms are defined as those that occur through the local console; remote administrative sessions (and their associated authentication mechanisms) are specified in FTP TRP.1/Admin.

According to the application note for FMT\_SMR.2, for distributed TOEs at least one TOE component has to support the authentication of Security Administrators according to FIA\_UIA\_EXT.1 and FIA\_UAU\_EXT.2 but not necessarily all TOE components. In case not all TOE components support this way of authentication for Security Administrators the TSS shall describe how Security Administrators are authenticated and identified.

#### **6.5.4.2 FIA UAU.7 Protected Authentication Feedback**

#### FIA UAU.7

#### **Protected Authentication Feedback**

**FIA\_UAU.7.1** The TSF shall provide only *obscured feedback* to the administrative user while the authentication is in progress **at the local console**.

#### **Application Note 21**

"Obscured feedback" implies the TSF does not produce a visible display of any authentication data entered by a user (such as the echoing of a password), although an obscured indication of progress may be provided (such as an asterisk for each character). It also implies that the TSF does not return any information during the authentication process to the user that may provide any indication of the authentication data.

## 6.6 Security Management (FMT)

Management functions required in this section describe required capabilities to support a Security Administrator role and basic set of security management functions dealing with management of configurable aspects included in other SFRs (FMT\_SMF.1), general management of TSF data (FMT\_MTD.1/CoreData), and enabling TOE updates (FMT\_MOF.1/ManualUpdate).

For distributed TOEs security management of TOE components could be realized for every TOE component directly or through other TOE components. The TSS shall describe which management SFRs and management functions apply to each TOE component (applies only to distributed TOEs).

These core management requirements are supplemented by selection-based requirements in section B.6, according to the TOE capabilities.

#### 6.6.1 Management of functions in TSF (FMT MOF)

#### 6.6.1.1 FMT MOF.1/ManualUpdate

Management of security functions behaviour

#### FMT MOF.1/ManualUpdate

Management of security functions behaviour

**FMT\_MOF.1.1/ManualUpdate** The TSF shall restrict the ability to <u>enable</u> the functions *to* perform manual updates to Security Administrators.

#### **Application Note 22**

FMT\_MOF.1/ManualUpdate restricts the initiation of manual updates to Security Administrators.

## 6.6.2 Management of TSF Data (FMT MTD)

## 6.6.2.1 FMT MTD.1/CoreData Management of TSF Data

## FMT\_MTD.1/CoreData Management of TSF Data

**FMT\_MTD.1.1/CoreData** The TSF shall restrict the ability to <u>manage</u> the TSF data to Security Administrators.

## **Application Note 23**

The word "manage" includes but is not limited to create, initialize, view, change default, modify, delete, clear, and append. This SFR includes also the resetting of user passwords by the Security Administrator. The identifier "CoreData" has been added here to separate this iteration of FMT\_MTD.1 from the optional iteration of FMT\_MTD.1 defined in Appendix A.4.2.1 (FMT MTD.1/CryptoKeys).

## 6.6.3 Specification of Management Functions (FMT SMF)

## 6.6.3.1 FMT SMF.1 Specification of Management Functions

#### FMT SMF.1

## **Specification of Management Functions**

**FMT SMF.1.1** The TSF shall be capable of performing the following management functions:

- *Ability to administer the TOE locally and remotely;*
- *Ability to configure the access banner;*
- Ability to configure the session inactivity time before session termination or locking;
- Ability to update the TOE, and to verify the updates using [selection: digital signature, hash comparison] capability prior to installing those updates;
- Ability to configure the authentication failure parameters for FIA AFL.1;
- [selection:
  - Ability to start and stop services;
  - Ability to configure audit behaviour;
  - Ability to modify the behaviour of the transmission of audit data to an external IT entity, the handling of audit data, the audit functionality when Local Audit Storage Space is full;
  - Ability to configure the list of TOE-provided services available before an entity is identified and authenticated, as specified in FIA UIA EXT.1;
  - Ability to manage the cryptographic keys;
  - o Ability to configure the cryptographic functionality;
  - Ability to configure thresholds for SSH rekeying;
  - o Ability to configure the lifetime for IPsec SAs;
  - Ability to configure the interaction between TOE components;
  - Ability to enable or disable automatic checking for updates or automatic updates;
  - Ability to re-enable an Administrator account;
  - Ability to set the time which is used for time-stamps;

- Ability to configure NTP:
- Ability to configure the reference identifier for the peer;
- Ability to manage the TOE's trust store and designate X509.v3 certificates as trust anchors:
- Ability to import X.509v3 certificates to the TOE's trust store;
- No other capabilities].

The TOE must provide functionality for both local and remote administration in general. This cPP does not mandate, though, a specific security management function to be available either through the local administration interface, the remote administration interface or both. The TSS shall detail which security management functions are available through which interface(s). The TOE must provide functionality to configure the access banner for FTA TAB.1 and the session inactivity time(s) for FTA SSL EXT.1 and FTA SSL.3. The item "Ability to update the TOE, and to verify the updates using digital signature capability prior to installing those updates" includes the relevant management functions from FMT MOF.1/ManualUpdate, FMT MOF.1/AutoUpdate (if included in the ST), FIA X509 EXT.2.2 and FPT TUD EXT.1.2 and FPT TUD EXT.2.2 (if included in the ST and if they include an Administrator-configurable action). Similarly, the selection "Ability to configure audit behaviour" includes the relevant management functions from FMT MOF.1/Services and FMT MOF.1/Functions, (for all of these SFRs that are included in the ST). If the TOE offers the ability for a remote Administrator account to be disabled in line with FIA AFL.1 them the ST author should select "Ability to re-enable an Administrator account" to allow the account to be re-enabled by a local Administrator. If the TOE offers the ability for the Administrator to configure the audit behaviour, configure the services available prior to identification or authentication, or if any of the cryptographic functionality on the TOE can be configured, or if the ST is describing a distributed TOE, then the ST author makes the appropriate choice or choices in the second selection, otherwise select "No other capabilities" (in the latter case the selection may alternatively be left blank in the ST).

The selection "Ability to start and stop services" shall be included in the ST if the TOE supports starting and stopping services of the TOE. If this selection is included in the ST, FMT\_MOF. I/Services shall be claimed in the ST.

The selection "Ability to manage the cryptographic keys" shall be included in the ST if the TOE supports management of cryptographic keys (e.g. generation of cryptographic keys). If this selection is included in the ST, FMT MTD.1/CryptoKeys shall be claimed in the ST.

The selection "Ability to configure the list of TOE-provided services available before an entity is identified and authenticated, as specified in FIA\_UIA\_EXT.1" shall be included in the ST if the TOE supports configuration of the list of TOE-provided services which are available before any entity is identified and authenticated. The term 'list' refers to the resulting list of available services as a result of the configuration activities. The configuration activity itself does not necessarily have to be modification of a list but could be any type of activation and deactivation procedure.

The selection "Ability to configure thresholds for SSH rekeying" shall be included in the ST if the TOE supports configuration of the thresholds for the mechanisms used to fulfil FCS\_SSHC\_EXT.1.8 or FCS\_SSHS\_EXT.1.8 (such configuration then requires the inclusion of FMT\_MOF.1/Functions in the ST). If the TOE places limits on the values accepted for the thresholds, then this is stated in the TSS.

The selection "Ability to configure lifetime for IPsec SAs" shall be included in the ST if the TOE supports secure communication via IPsec and the FCS\_IPSEC\_EXT.1 requirements are included in the ST. The configuration of the lifetime for IPsec SAs needs to be in line with the selection in FCS\_IPSEC\_EXT.1.7 (such configuration then requires the inclusion of FMT MOF.1/Functions in the ST).

The selection "Ability to set the time which is used for time-stamps" shall be included in the ST if the TOE allows the Administrator to set the time of the device which is then used in time stamps. This option shall not be selected if the TOE does not allow manual time setting but only relies on synchronization with external time sources like NTP servers.

The selection "Ability to configure NTP" shall be included in the ST if the TOE uses NTP for timestamp configuration. If selected, FCS\_NTP\_EXT.1 shall be included in the ST as well.

The selection "Ability to configure the reference identifier for the peer" shall be included in the ST if the TOE supports secure communications via the IPsec protocol and the FCS\_IPSEC\_EXT.1 requirements are included in the ST. For TOEs that support only IP address and FQDN identifier types, configuration of the reference identifier may be the same as configuration of the peer's name for the purposes of connection.

The selection "Ability to manage the TOE's trust store and designate X509.v3 certificates as trust anchors" shall be included in the ST if the TOE supports management and configuration of the TOE's trust store. This means the TOE supports X.509v3 certificates for some security functions.

The selection "Ability to import X.509v3 certificates to the TOE's trust store" shall be included in the ST if the TOE supports loading of X.509 certificates to the TOE's trust store.

For distributed TOEs the interaction between TOE components will be configurable (see FCO\_CPC\_EXT.1). Therefore, the ST author includes the selection "Ability to configure the interaction between TOE components" for distributed TOEs. A simple example would be the change of communication protocol according to FPT\_ITT.1. Another example would be changing the management of a TOE component from direct remote administration to remote administration through another TOE component. A more complex use case would be if the realization of an SFR is achieved through two or more TOE components and the responsibilities between the two or more components could be modified.

For distributed TOEs that implement a registration channel (as described in FCO\_CPC\_EXT.1.2), the ST author uses the selection "Ability to configure the cryptographic functionality" in this SFR, and its corresponding mapping in the TSS, to describe the configuration of any cryptographic aspects of the registration channel that can be modified by the operational environment in order to improve the channel security (cf. the description of the content of Preparative Procedures in [SD, 3.6.1.2]).

#### 6.6.4 Security management roles (FMT SMR)

## 6.6.4.1 FMT SMR.2 Restrictions on security roles

## FMT SMR.2

## **Restrictions on Security Roles**

**FMT SMR.2.1** The TSF shall maintain the roles:

• Security Administrator.

FMT SMR.2.2 The TSF shall be able to associate users with roles.

FMT SMR.2.3 The TSF shall ensure that the conditions

- *The Security Administrator role shall be able to administer the TOE locally;*
- The Security Administrator role shall be able to administer the TOE remotely

are satisfied.

#### **Application Note 25**

FMT\_SMR.2.3 requires that a Security Administrator be able to administer the TOE through the local console and through a remote mechanism. The ST Author must select FTP\_ITC.1, FPT ITT.1 and/or FTP TRP.1/Admin to demonstrate how secure communication is achieved.

For distributed TOEs not every TOE component is required to implement its own user management to fulfil this SFR. At least one component has to support authentication and identification of Security Administrators according to FIA\_UIA\_EXT.1 and FIA\_UAU\_EXT.2. For the other TOE components authentication as Security Administrator can be realized through the use of a trusted channel (either according to FTP\_ITC.1 or FPT\_ITT.1) from a component that supports the authentication of Security Administrators according to FIA\_UIA\_EXT.1 and FIA\_UAU\_EXT.2. The identification of users according to FIA\_UIA\_EXT.1.2 and the association of users with roles according to FMT\_SMR.2.2 is done through the components that support the authentication of Security Administrators according to FIA\_UIA\_EXT.1 and FIA\_UAU\_EXT.2. TOE components that authenticate Security Administrators through the use of a trusted channel are not required to support local administration of the component as defined in FMT\_SMR.2.3.

## 6.7 Protection of the TSF (FPT)

This section defines requirements for the TOE to protect critical security data such as keys and passwords, to provide self-tests that monitor continued correct operation of the TOE (including detection of failures of firmware or software integrity), and to provide trusted methods for updates to the TOE firmware/software. In addition, the TOE is required to provide reliable timestamps in order to support accurate audit recording under the FAU\_GEN family.

## 6.7.1 Protection of TSF Data (Extended – FPT SKP EXT)

# 6.7.1.1 FPT\_SKP\_EXT.1 Protection of TSF Data (for reading of all pre-shared, symmetric and private keys)

# FPT\_SKP\_EXT.1 Protection of TSF Data (for reading of all pre-shared, symmetric and private keys)

**FPT\_SKP\_EXT.1.1** The TSF shall prevent reading of all pre-shared keys, symmetric keys, and private keys.

## **Application Note 26**

The intent of this requirement is for the device to protect keys, key material, and authentication credentials from unauthorized disclosure. This data should only be accessed for the purposes of their assigned security functionality, and there is no need for them to be displayed/accessed at any other time. This requirement does not prevent the device from providing indication that these exist, are in use, or are still valid. It does, however, restrict the reading of the values outright.

## 6.7.2 Protection of Administrator Passwords (Extended – FPT APW EXT)

## 6.7.2.1 FPT APW EXT.1 Protection of Administrator Passwords

## FPT\_APW\_EXT.1 Protection of Administrator Passwords

**FPT APW EXT.1.1** The TSF shall store passwords in non-plaintext form.

**FPT APW EXT.1.2** The TSF shall prevent the reading of plaintext passwords.

#### Application Note 27

The intent of the requirement is that raw password authentication data is not stored in the clear, and that no user or Administrator is able to read the plaintext password through "normal" interfaces. An all-powerful Administrator could directly read memory to capture a password but is trusted not to do so. Passwords should be obscured during entry on the local console in accordance with FIA UAU.7.

#### 6.7.3 TSF testing (Extended – FPT TST EXT)

In order to detect some number of failures of underlying security mechanisms used by the TSF, the TSF will perform self-tests. The extent of this self-testing is left to the product developer, but a more comprehensive set of self-tests should result in a more trustworthy platform on which to develop enterprise architecture.

(For this component, selection-based requirements exist in Appendix B)

#### 6.7.3.1 FPT TST EXT.1 TSF Testing (Extended)

## FPT\_TST\_EXT.1 TSF testing

**FPT\_TST\_EXT.1.1** The TSF shall run a suite of the following self-tests [selection: during initial start-up (on power on), periodically during normal operation, at the request of the authorised user, at the conditions [assignment: conditions under which self-tests should occur] to demonstrate the correct operation of the TSF: [assignment: list of self-tests run by the TSF].

#### **Application Note 28**

It is expected that self-tests are carried out during initial start-up (on power on). Other options should only be used if the developer can justify why they are not carried out during initial start-up. It is expected that at least self-tests for verification of the integrity of the firmware and software as well as for the correct operation of cryptographic functions necessary to fulfil the SFRs will be performed. If not all self-tests are performed during start-up multiple iterations of this SFR are used with the appropriate options selected. In future versions of this cPP the suite of self-tests will be required to contain at least mechanisms for measured boot including self-tests of the components which perform the measurement.

Non-distributed TOEs may internally consist of several components that contribute to enforcing SFRs. Self-testing shall cover all components that contribute to enforcing SFRs and verification of integrity shall cover all software that contributes to enforcing SFRs on all components.

For distributed TOEs all TOE components have to perform self-tests. This does not necessarily mean that each TOE component has to carry out the same self-tests: the ST describes the applicability of the selection (i.e. when self-tests are run) and the final assignment (i.e. which self-tests are carried out) to each TOE component.

## **Application Note 29**

If certificates are used by the self-test mechanism (e.g. for verification of signatures for integrity verification), certificates are validated in accordance with FIA\_X509\_EXT.1/Rev and should be selected in FIA\_X509\_EXT.2.1. Additionally, FPT\_TST\_EXT.2 must be included in the ST.

## **6.7.4** Trusted Update (FPT\_TUD\_EXT)

Failure by the Security Administrator to verify that updates to the system can be trusted may lead to compromise of the entire system. To establish trust in the source of the updates, the system can provide cryptographic mechanisms and procedures to procure the update, check the update cryptographically through the TOE-provided digital signature mechanism, and install the update on the system. While there is no requirement that this process be completely automated, guidance documentation will detail any procedures that must be performed manually, as well as the manner in which the Administrator ensures that the signature on the update is valid.

(For this family, selection-based requirements exist in Appendix B)

#### 6.7.4.1 FPT TUD EXT.1 Trusted Update

## FPT\_TUD\_EXT.1 Trusted update

**FPT\_TUD\_EXT.1.1** The TSF shall provide *Security Administrators* the ability to query the currently executing version of the TOE firmware/software and [selection: *the most recently installed version of the TOE firmware/software; no other TOE firmware/software version*].

## **Application Note 30**

If a trusted update can be installed on the TOE with a delayed activation the version of both the currently executing image and the installed but inactive image must be provided. In this case the option 'the most recently installed version of the TOE firmware/software' needs to be chosen from the selection in FPT\_TUD\_EXT.1.1 and the TSS needs to describe how and when the inactive version becomes active. If all trusted updates become active as part of the installation process, only the currently executing version needs to be provided. In this case the option 'no other TOE firmware/software version' shall be chosen from the selection in FPT\_TUD\_EXT.1.1..

For a distributed TOE, the method of determining the installed versions on each component of the TOE is described in the operational guidance.

**FPT\_TUD\_EXT.1.2** The TSF shall provide *Security Administrators* the ability to manually initiate updates to TOE firmware/software and [selection: *support automatic checking for updates, support automatic updates, no other update mechanism*].

## **Application Note 31**

The selection in FPT\_TUD\_EXT.1.2 distinguishes the support of automatic checking for updates and support of automatic updates. The first option refers to a TOE that checks whether a new update is available, communicates this to the Administrator (e.g. through a message during an administrative session, through log files) but requires some action by the Administrator to actually perform the update. The second option refers to a TOE that checks for updates and automatically installs them upon availability.

The TSS explains what actions are involved in the TOE support when using the "support automatic checking for updates" or "support automatic updates" selections.

When published hash values (see FPT\_TUD\_EXT.1.3) are used to protect the trusted update mechanism, the TOE must not automatically download the update file(s) together with the hash value (either integrated in the update file(s) or separately) and automatically install the update without any active authorization by the Security Administrator, even when the calculated hash value matches the published hash value. When using published hash values to protect the trusted update mechanism, the option "support of automatic updates" must not be used (automated checking for updates is permitted, though). The TOE may automatically download the update file(s) themselves but not to the hash value. For the published hash approach, it is intended that a Security Administrator is always required to give active authorisation for installation of an update (as described in more detail under FPT\_TUD\_EXT.1.3) below. Due to this, the type of update mechanism is regarded as "manually initiated update", even if the update file(s) may be downloaded automatically. A fully automated approach (without Security Administrator intervention) can only be used when "digital signature mechanism" is selected in FPT\_TUD\_EXT.1.3 below.

**FPT\_TUD\_EXT.1.3** The TSF shall provide means to authenticate firmware/software updates to the TOE using a [selection: *digital signature mechanism, published hash*] prior to installing those updates.

## **Application Note 32**

The digital signature mechanism referenced in the selection of FPT\_TUD\_EXT.1.3 is one of the algorithms specified in FCS\_COP.1/SigGen. The published hash referenced in FPT\_TUD\_EXT.1.3 is generated by one of the functions specified in FCS\_COP.1/Hash. The ST author should choose the mechanism implemented by the TOE; it is acceptable to implement both mechanisms.

When published hash values are used to secure the trusted update mechanism, an active authorization of the update process by the Security Administrator is always required. The secure transmission of an authentic hash value from the developer to the Security Administrator is one of the key factors to protect the trusted update mechanism when using published hashes and the guidance documentation needs to describe how this transfer has to be performed. For the verification of the trusted hash value by the Security Administrator different use cases are possible. The Security Administrator could obtain the published hash value as well as the update file(s) and perform the verification outside the TOE while the hashing of the update file(s) could be done by the TOE or by other means. Authentication as Security Administrator and initiation of the trusted update would in this case be regarded as "active authorization" of the trusted update. Alternatively, the Administrator could provide the *TOE* with the published hash value together with the update file(s) and the hashing and hash comparison is performed by the TOE. In case of successful hash verification, the TOE can perform the update without any additional step by the Security Administrator. Authentication as Security Administrator and sending the hash value to the TOE is regarded as "active authorization" of the trusted update (in case of successful hash verification), because the Administrator is expected to load the hash value only to the TOE when intending to perform the update. As long as the transfer of the hash value to the TOE is performed by the Security Administrator, loading of the update file(s) can be performed by the Security Administrator or can be automatically downloaded by the TOE from a repository.

If the digital signature mechanism is selected, the verification of the signature shall be performed by the TOE itself. For the published hash option, the verification can be done by the TOE itself as well as by the Security Administrator. In the latter case use of TOE functionality for the verification is not mandated, so verification could be done using non-TOE functionality of the device containing the TOE or without using the device containing the TOE.

For distributed TOEs all TOE components shall support Trusted Update. The verification of the signature or hash on the update shall either be done by each TOE component itself (signature verification) or for each TOE component (hash verification).

Updating a distributed TOE might lead to the situation where different TOE components are running different software versions. Depending on the differences between the different software versions the impact of a mixture of different software versions might be no problem at all or critical to the proper functioning of the TOE. The TSS shall detail the mechanisms that support the continuous proper functioning of the TOE during trusted update of distributed TOEs.

Future versions of this cPP will mandate the use of a digital signature mechanism for trusted updates.

## **Application Note 34**

If certificates are used by the update verification mechanism, certificates are validated in accordance with FIA\_X509\_EXT.1/Rev and should be selected in FIA\_X509\_EXT.2.1. Additionally, FPT\_TUD\_EXT.2 must be included in the ST.

## **Application Note 35**

"Update" in the context of this SFR refers to the process of replacing a non-volatile, system resident software component with another. The former is referred to as the NV image, and the latter is the update image. While the update image is typically newer than the NV image, this is not a requirement. There are legitimate cases where the system owner may want to rollback a component to an older version (e.g. when the component manufacturer releases a faulty update, or when the system relies on an undocumented feature no longer present in the update). Likewise, the owner may want to update with the same version as the NV image to recover from faulty storage.

All discrete firmware and software elements (e.g. applications, drivers, and kernel) of the TSF need to be protected, i.e. they should either be digitally signed by the corresponding manufacturer and subsequently verified by the mechanism performing the update or a hash should be published for them which needs to be verified before the update.

## 6.7.5 Time stamps (Extended – FPT STM EXT))

#### 6.7.5.1 FPT STM EXT.1 Reliable Time Stamps

## FPT\_STM\_EXT.1 Reliable Time Stamps

**FPT STM EXT.1.1** The TSF shall be able to provide reliable time stamps for its own use.

**FPT\_STM\_EXT.1.2** The TSF shall [selection: *allow the Security Administrator to set the time, synchronise time with an NTP server*].

## **Application Note 36**

Reliable time stamps are expected to be used with other TSF, e.g. for the generation of audit data to allow the Security Administrator to investigate incidents by checking the order of events and to determine the actual local time when events occurred. The decision about the required level of accuracy of that information is up to the Administrator.

The TOE depends on time and date information, either provided by a local real-time clock that is manually managed by the Security Administrator or through the use of one or more external NTP servers. The corresponding option(s) shall be chosen from the selection in FPT\_STM\_EXT.1.2. The use the automatic synchronisation with an external NTP server is recommended but not mandated. Note that for the communication with an external NTP server,

FCS\_NTP\_EXT.1 shall be claimed. The ST author describes in the TSS how the external time and date information is received by the TOE and how this information is maintained.

The term "reliable time stamps" refers to the strict use of the time and date information, that is provided, and the logging of all discontinuous changes to the time settings including information about the old and new time. With this information, the real time for all audit data can be determined. Note, that all discontinuous time changes, Administrator actuated or changed via an automated process, must be audited. No audit is needed when time is changed via use of kernel or system facilities – such as daytime (3) – that exhibit no discontinuities in time.

For distributed TOEs it is expected that the Security Administrator ensures synchronization between the time settings of different TOE components. All TOE components shall either be in sync (e.g. through synchronisation between TOE components or through synchronisation of different TOE components with external NTP servers) or the offset should be known to the Administrator for every pair of TOE components. This includes TOE components synchronized to different time zones.

## 6.8 TOE Access (FTA)

This section specifies requirements associated with security of administrative sessions carried out on the TOE. In particular, both local and remote sessions are monitored for inactivity and either locked or terminated when a threshold time period is reached. Administrators must also be able to positively terminate their own interactive sessions, and must have an advisory notice displayed at the start of each session.

#### 6.8.1 TSF-initiated Session Locking (Extended – FTA SSL EXT)

## 6.8.1.1 FTA\_SSL\_EXT.1 TSF-initiated Session Locking

## FTA SSL EXT.1 TSF-initiated Session Locking

**FTA SSL EXT.1.1** The TSF shall, for local interactive sessions, [selection:

- lock the session disable any activity of the user's data access/display devices other than unlocking the session, and requiring that the Administrator re-authenticate to the TSF prior to unlocking the session;
- *terminate the session*]

after a Security Administrator-specified time period of inactivity.

#### 6.8.2 Session locking and termination (FTA SSL)

## 6.8.2.1 FTA\_SSL.3 TSF-initiated Termination (Refinement)

#### FTA SSL.3

## **TSF-initiated Termination**

**FTA\_SSL.3.1:** The TSF shall terminate **a remote** interactive session after a *Security Administrator-configurable time interval of session inactivity.* 

## **6.8.2.2 FTA\_SSL.4 User-initiated Termination (Refinement)**

## FTA SSL.4

## **User-initiated Termination**

FTA\_SSL.4.1: The TSF shall allow Administrator-initiated termination of the Administrator's own interactive session.

#### 6.8.3 TOE access banners (FTA TAB)

## **6.8.3.1 FTA TAB.1 Default TOE Access Banners (Refinement)**

#### FTA TAB.1

#### **Default TOE Access Banners**

FTA\_TAB.1.1: Before establishing an administrative user session the TSF shall display a Security Administrator-specified advisory notice and consent warning message regarding use of the TOE.

## **Application Note 37**

This requirement is intended to apply to interactive sessions between a human user and a TOE. IT entities establishing connections or programmatic connections (e.g., remote procedure calls over a network) are not required to be covered by this requirement.

## 6.9 Trusted path/channels (FTP)

To address the issues concerning transmitting sensitive data to and from the TOE, compliant TOEs will provide encryption for these communication paths between themselves and the endpoint. These channels are implemented using one (or more) of five standard protocols: IPsec, TLS, DTLS, HTTPS, and SSH. These protocols are specified by RFCs that offer a variety of implementation choices. Requirements have been imposed on some of these choices (particularly those for cryptographic primitives) to provide interoperability and resistance to cryptographic attack.

In addition to providing protection from disclosure (and detection of modification) for the communications, each of the protocols described (IPsec, SSH, TLS, DTLS and HTTPS) offer two-way authentication of each endpoint in a cryptographically secure manner, meaning that

even if there was a malicious attacker between the two endpoints, any attempt to represent themselves to either endpoint of the communications path as the other communicating party would be detected.

## 6.9.1 Trusted Channel (FTP ITC)

## 6.9.1.1 FTP ITC.1 Inter-TSF trusted channel (Refinement)

## FTP ITC.1

#### **Inter-TSF** trusted channel

FTP\_ITC.1.1 The TSF shall be capable of using [selection: IPsec, SSH, TLS, DTLS, HTTPS] to provide a trusted communication channel between itself and authorized IT entities supporting the following capabilities: audit server, [selection: authentication server, [assignment: other capabilities], no other capabilities] that is logically distinct from other communication channels and provides assured identification of its end points and protection of the channel data from disclosure and detection of modification of the channel data.

FTP\_ITC.1.2 The TSF shall permit the TSF or the authorized IT entities to initiate communication via the trusted channel.

**FTP\_ITC.1.3** The TSF shall initiate communication via the trusted channel for [assignment: list of services for which the TSF is able to initiate communications].

## **Application Note 38**

The intent of the above requirement is to provide a means by which a cryptographic protocol may be used to protect external communications with authorized IT entities that the TOE interacts with to perform its functions. The TOE uses at least one of the listed protocols for communications with the server that collects the audit information. If it communicates with an authentication server (e.g., RADIUS), then the ST author chooses "authentication server" in FTP\_ITC.1.1 and this connection must be capable of being protected by one of the listed protocols. If other authorized IT entities are protected, the ST author makes the appropriate assignments (for those entities) and selections (for the protocols that are used to protect those connections). The ST author selects the mechanism or mechanisms supported by the TOE, and then ensures that the detailed protocol requirements in Appendix B corresponding to their selection are included in the ST.

While there are no requirements on the party initiating the communication, the ST author lists in the assignment for FTP\_ITC.1.3 the services for which the TOE can initiate the communication with the authorized IT entity.

The requirement implies that not only are communications protected when they are initially established, but also on resumption after an outage. It may be the case that some part of the TOE setup involves manually setting up tunnels to protect other communication, and if after an outage the TOE attempts to re-establish the communication automatically with (the necessary) manual intervention, there may be a window created where an attacker might be able to gain critical information or compromise a connection.

Where public key certificates are used in support of an FTP\_ITC.1 channel, FIA\_X509\_EXT.1/Rev is to be used (this requires checking certificate revocation), and not the iteration FIA\_X509\_EXT.1/ITT which is only for use in inter-component channels of a distributed TOE.

# 6.9.2 Trusted Path (FTP TRP)

# 6.9.2.1 FTP TRP.1/Admin Trusted Path (Refinement)

# FTP TRP.1/Admin Trusted Path

FTP\_TRP.1.1/Admin The TSF shall be capable of using [selection: *DTLS*, *IPsec*, *SSH*, *TLS*, *HTTPS*] to provide a communication path between itself and authorized remote Administrators that is logically distinct from other communication paths and provides assured identification of its end points and protection of the communicated data from <u>disclosure and</u> provides detection of modification of the channel data.

**FTP\_TRP.1.2/Admin** The TSF shall permit <u>remote **Administrators**</u> to initiate communication via the trusted path.

**FTP\_TRP.1.3/Admin** The TSF shall require the use of the trusted path for <u>initial</u> Administrator authentication and all remote administration actions.

## **Application Note 39**

This requirement ensures that authorized remote Administrators initiate all communication with the TOE via a trusted path, and that all communication with the TOE by remote Administrators is performed over this path. The data passed in this trusted communication channel is encrypted as defined by the protocol chosen in the first selection. The ST author selects the mechanism or mechanisms supported by the TOE, and then ensures that the detailed protocol requirements in Appendix B corresponding to their selection are included in the ST.

# 7. Security Assurance Requirements

This cPP identifies the Security Assurance Requirements (SARs) to frame the extent to which the evaluator assesses the documentation applicable for the evaluation and performs independent testing.

This section lists the set of SARs from CC part 3 that are required in evaluations against this cPP. Individual Evaluation Activities to be performed are specified in [SD].

The general model for evaluation of TOEs against STs written to conform to this cPP is as follows: after the ST has been approved for evaluation, the ITSEF will obtain the TOE, supporting environmental IT (if required), and the guidance documentation for the TOE. The ITSEF is expected to perform actions mandated by the Common Evaluation Methodology (CEM) for the ASE and ALC SARs. The ITSEF also performs the Evaluation Activities contained within the SD, which are intended to be an interpretation of the other CEM assurance requirements as they apply to the specific technology instantiated in the TOE. The Evaluation Activities that are captured in [SD] also provide clarification as to what the developer needs to provide to demonstrate the TOE is compliant with the cPP.

Vulnerability assessment (AVA)	Vulnerability survey (AVA_VAN.1)	

Table 3: Security Assurance Requirements

# 7.1 **ASE:** Security Target

The ST is evaluated as per ASE activities defined in the CEM. In addition, there may be Evaluation Activities specified within [SD] that call for necessary descriptions to be included in the TSS that are specific to the TOE technology type.

Appendix D provides a description of the information expected to be provided regarding the quality of entropy in the random bit generator.

ASE\_TSS.1.1C Refinement: The TOE summary specification shall describe how the TOE meets each SFR. In the case of entropy analysis, the TSS is used in conjunction with required supplementary information on Entropy.

The requirements for exact conformance of the Security Target are described in section 2.

# 7.2 ADV: Development

The design information about the TOE is contained in the guidance documentation available to the end user as well as the TSS portion of the ST, and any required supplementary information required by this cPP that is not to be made public.

# 7.2.1 Basic Functional Specification (ADV FSP.1)

The functional specification describes the TOE Security Functions Interfaces (TSFIs). It is not necessary to have a formal or complete specification of these interfaces. Additionally, because TOEs conforming to this cPP will necessarily have interfaces to the Operational Environment that are not directly invokable by TOE users, there is little point specifying that such interfaces be described in and of themselves since only indirect testing of such interfaces may be possible. For this cPP, the Evaluation Activities for this family focus on understanding the interfaces presented in the TSS in response to the functional requirements and the interfaces presented in the AGD documentation. No additional "functional specification" documentation is necessary to satisfy the Evaluation Activities specified in [SD].

The Evaluation Activities in [SD] are associated with the applicable SFRs; since these are directly associated with the SFRs, the tracing in element ADV\_FSP.1.2D is implicitly already done and no additional documentation is necessary.

# 7.3 AGD: Guidance Documentation

The guidance documents will be provided with the ST. Guidance must include a description of how the IT personnel verifies that the Operational Environment can fulfil its role for the security functionality. The documentation should be in an informal style and readable by the IT personnel.

Guidance must be provided for every operational environment that the product supports as claimed in the ST. This guidance includes:

- instructions to successfully install the TSF in that environment; and
- instructions to manage the security of the TSF as a product and as a component of the larger operational environment; and
- instructions to provide a protected administrative capability.

Guidance pertaining to particular security functionality must also be provided; requirements on such guidance are contained in the Evaluation Activities specified in [SD].

## 7.3.1 Operational User Guidance (AGD OPE.1)

The operational user guidance does not have to be contained in a single document. Guidance to users, Administrators and application developers can be spread among documents or web pages.

The developer should review the Evaluation Activities contained in [SD] to ascertain the specifics of the guidance that the evaluator will be checking for. This will provide the necessary information for the preparation of acceptable guidance.

# 7.3.2 Preparative Procedures (AGD PRE.1)

As with the operational guidance, the developer should look to the Evaluation Activities to determine the required content with respect to preparative procedures.

It is noted that specific requirements for Preparative Procedures are defined in [SD] for distributed TOEs as part of the Evaluation Activities for FCO\_CPC\_EXT.1 and FTP\_TRP.1/Join.

# 7.4 Class ALC: Life-cycle Support

At the assurance level provided for TOEs conformant to this cPP, life-cycle support is limited to end-user-visible aspects of the life-cycle, rather than an examination of the TOE vendor's development and configuration management process. This is not meant to diminish the critical role that a developer's practices play in contributing to the overall trustworthiness of a product; rather, it is a reflection on the information to be made available for evaluation at this assurance level.

# 7.4.1 Labelling of the TOE (ALC CMC.1)

This component is targeted at identifying the TOE such that it can be distinguished from other products or versions from the same vendor and can be easily specified when being procured by an end user. A label could consist of a "hard label" (e.g., stamped into the metal, paper label) or a "soft label" (e.g., electronically presented when queried). The evaluator performs the CEM work units associated with ALC CMC.1.

## 7.4.2 TOE CM Coverage (ALC CMS.1)

Given the scope of the TOE and its associated evaluation evidence requirements, the evaluator performs the CEM work units associated with ALC CMS.1.

## 7.5 Class ATE: Tests

Testing is specified for functional aspects of the system as well as aspects that take advantage of design or implementation weaknesses. The former is done through the ATE\_IND family, while the latter is through the AVA\_VAN family. For this cPP, testing is based on advertised

functionality and interfaces with dependency on the availability of design information. One of the primary outputs of the evaluation process is the test report as specified in the following requirements.

# 7.5.1 Independent Testing – Conformance (ATE\_IND.1)

Testing is performed to confirm the functionality described in the TSS as well as the guidance documentation (includes "evaluated configuration" instructions). The focus of the testing is to confirm that the requirements specified in Section 5.1.7 are being met. The Evaluation Activities in [SD] identify the specific testing activities necessary to verify compliance with the SFRs. The evaluator produces a test report documenting the plan for and results of testing, as well as coverage arguments focused on the platform/TOE combinations that are claiming conformance to this cPP.

# 7.6 Class AVA: Vulnerability Assessment

For the first generation of this cPP, the iTC is expected to survey open sources to discover what vulnerabilities have been discovered in these types of products and provide that content into the AVA\_VAN discussion. In most cases, these vulnerabilities will require sophistication beyond that of a basic attacker. This information will be used in the development of future protection profiles.

# 7.6.1 Vulnerability Survey (AVA VAN.1)

[SD, Appendix A] provides a guide to the evaluator in performing a vulnerability analysis.

# A. Optional Requirements

As indicated in the introduction to this cPP, the baseline requirements (those that must be performed by the TOE) are contained in the body of this cPP. Additionally, there are two other types of requirements specified in Appendices A and B.

The first type (in this Appendix) comprises requirements that can be included in the ST, but are not mandatory for a TOE to claim conformance to this cPP. The second type (in Appendix B) comprises requirements based on selections in other SFRs from the cPP: if certain selections are made, then additional requirements in that appendix will need to be included in the body of the ST (e.g., cryptographic protocols selected in a trusted channel requirement).

If a TOE fulfils any of the optional requirements, the vendor is encouraged to add the related functionality to the ST. Therefore, in the application notes of this chapter the wording "This option should be chosen..." is repeatedly used. But it also is used to emphasize that this option should only be chosen if the TOE provides the related functionality and that it is not necessary to implement the related functionality to be compliant to the cPP. ST authors are free to choose none, some or all SFRs defined in this chapter. Just the fact that a product supports a certain functionality does not mandate to add any SFR defined in this chapter.

Table 4: TOE Optional SFRs and Auditable Events

## **Application Note 40**

The audit event for FIA\_X509\_EXT.1/ITT is based on the TOE not being able to complete the certificate validation by ensuring the following:

- the presence of the basicConstraints extension and that the CA flag is set to TRUE for all CA certificates.
- Verification of the digital signature of the trusted hierarchical CA
- read/access the CRL or access the OCSP server (according to selection in the ST).

If any of these checks fails, then an audit event with the failure should be written to the audit log.

# A.2 Security Audit (FAU)

# A.2.1 Security audit event storage (FAU\_STG.1 & Extended – FAU\_STG\_EXT)

Local storage space for audit data may be necessary on the TOE itself, and the TOE may then claim protection of the audit trail against unauthorised modification (including deletion) as described in FAU\_STG.1. The local storage space for audit data of a network device is also limited, and if the local storage space is exceeded then audit data might be lost. A security Administrator might be interested in the number of dropped, overwritten, etc. audit records. This number might serve as an indication if a severe problem has occurred after the storage space was exceeded that continuously generated audit data. Therefore, FAU\_STG\_EXT.2/LocSpace and FAU\_STG.3/LocSpace are defined to express these optional capabilities of a network device.

## A.2.1.1 FAU STG.1 Protected audit trail storage

## FAU STG.1 Protected audit trail storage

**FAU\_STG.1.1** The TSF shall protect the stored audit records in the audit trail from unauthorised deletion.

**FAU\_STG.1.2** The TSF shall be able to <u>prevent</u> unauthorised modifications to the stored audit records in the audit trail.

## A.2.1.2 FAU STG EXT.2/LocSpace Counting lost audit data

## FAU STG EXT.2/LocSpace

## Counting lost audit data

**FAU\_STG\_EXT.2.1/LocSpace** The TSF shall provide information about the number of [selection: *dropped, overwritten, [assignment: other information]*] audit records in the case where the local storage has been filled and the TSF takes one of the actions defined in FAU STG EXT.1.3.

## **Application Note 41**

This option should be chosen if the TOE supports this functionality.

In case the local storage for audit records is cleared by the Administrator, the counters associated with the selection in the SFR should be reset to their initial value (most likely to 0). The guidance documentation should contain a warning for the Administrator about the loss of audit data when he clears the local storage for audit records.

For distributed TOEs each component that implements counting of lost audit data has to provide a mechanism for Administrator access to, and management of, this information.

If FAU\_STG\_EXT.2/LocSpace is added to the ST, the ST has to make clear any situations in which lost audit data is not counted.

## A.2.1.3 FAU STG.3/LocSpace Action in case of possible audit data loss

## FAU STG.3/LocSpace

## Action in case of possible audit data loss

**FAU\_STG.3.1/LocSpace** The TSF shall *generate a warning to inform the Administrator* if the audit trail *exceeds the local audit trail storage capacity*.

## **Application Note 42**

This option should be chosen if the TOE generates a warning to inform the Administrator before the local storage space for audit data is used up. This might be useful if auditable events are stored on local storage space only.

It has to be ensured that the warning message required by FAU\_STG.3.1/LocSpace can be communicated to the Administrator. The communication should be done via the audit log itself because it cannot be guaranteed that an administrative session is active at the time the event occurs.

The warning should inform the Administrator when the local space to store audit data is used up and/or the TOE will lose audit data due to insufficient local space.

For distributed TOEs that implement displaying a warning when local storage space for audit data is exhausted, it has to be described which TOE components support this feature (not necessarily all TOE components have to support this feature if selected for the overall TOE). Each component that supports this feature shall either generate a warning itself or through another component.

If FAU\_STG.3/LocSpace is added to the ST, the ST has to make clear any situations in which audit records might be "invisibly lost".

# A.3 Identification and Authentication (FIA)

# A.3.1 Authentication using X.509 certificates (Extended – FIA\_X509\_EXT)

# A.3.1.1 FIA\_X509\_EXT.1/ITT Certificate Validation

# FIA X509 EXT.1/ITT X.509 Certificate Validation

**FIA\_X509\_EXT.1.1/ITT** The TSF shall validate certificates in accordance with the following rules:

- RFC 5280 certificate validation and certification path validation supporting a minimum path length of two certificates.
- The certification path must terminate with a trusted CA certificate.
- The TSF shall validate a certification path by ensuring that all CA certificates in the certification path contain the basicConstraints extension with the CA flag set to TRUE.
- The TSF shall validate the revocation status of the certificate using [selection: the Online Certificate Status Protocol (OCSP) as specified in RFC 6960, a Certificate Revocation List (CRL) as specified in RFC 5280 Section 6.3, Certificate Revocation List (CRL) as specified in RFC 5759 Section 5, no revocation method]
- The TSF shall validate the extendedKeyUsage field according to the following rules:
  - Server certificates presented for TLS shall have the Server Authentication purpose (id-kp 1 with OID 1.3.6.1.5.5.7.3.1) in the extendedKeyUsage field.
  - Client certificates presented for TLS shall have the Client Authentication purpose (id-kp 2 with OID 1.3.6.1.5.5.7.3.2) in the extendedKeyUsage field.
  - OCSP certificates presented for OCSP responses shall have the OCSP Signing purpose (id-kp 9 with OID 1.3.6.1.5.5.7.3.9) in the extendedKeyUsage field.

## **Application Note 43**

This SFR should be chosen if the TOE is distributed and the protocol(s) selected in FPT\_ITT.1 utilize X.509v3 certificates for peer authentication. In this case, the use of revocation list checking is optional as there are additional requirements surrounding the enabling and disabling of the ITT channel as defined in FCO\_CPC\_EXT.1. If the revocation checking is not supported, the ST author should select "no revocation method". However, if certificate revocation checking is supported, the ST author must select whether this is performed using OCSP or CRLs.

The TOE shall be capable of supporting a minimum path length of two certificates. That is, it shall support a certificate hierarchy comprising of at least a self-signed root certificate and a leaf certificate.

The chain validation is expected to terminate with a trust anchor. This means the validation can terminate with any trusted CA certificate designated as a trust anchor. This CA certificate must be loaded into the trust store ('certificate store', ' trusted CA Key Store' or similar) managed by the platform. If the TOE's trust store supports loading of multiple hierarchical CA certificates or certificate chains, the TOE must clearly indicate all certificates it considers trust anchors.

The validation of X.509v3 leaf certificates comprises several steps:

- a) A Certificate Revocation Check refers to the process of determining the current revocation status of an otherwise structurally valid certificate. This is optionally performed when a certificate is used for authentication, however this behaviour must be consistent. If this check is performed, it must be performed for each certificate in the chain up to, but not including, the trust anchor. This means that CA certificates that are not trust anchors, and leaf certificates in the chain, must be checked. It is not required to check the revocation status of any CA certificate designated a trust anchor, however if such check is performed it must be handled consistently with how other certificates are checked.
- b) An expiration check must be performed. This check must be conducted for each certificate in the chain, up to and including the trust anchor.
- c) The continuity of the chain must be checked, showing that the signature on each certificate that is presented to the TOE is valid and the chain terminates at the trust anchor.

If revocation checking is performed, it is expected that it is performed on both leaf and intermediate CA certificates when a leaf certificate is presented to the TOE as part of the certificate chain during authentication. Revocation checking of any CA certificate designated a trust anchor is not required. It is not sufficient to perform a revocation check of an intermediate CA certificate only when it is loaded onto the device.

If the TOE does not support functionality that uses any of the certificate types listed in the extendedKeyUsage rules in FIA\_X509\_EXT.1.1 then this is stated in the TSS and the relevant part of the SFR is considered trivially satisfied. However, if the TOE does support functionality that uses certificates of any of these types then the corresponding rule must of course be satisfied as in the SFR.

**FIA\_X509\_EXT.1.2/ITT** The TSF shall only treat a certificate as a CA certificate if the basicConstraints extension is present and the CA flag is set to TRUE.

## Application Note 44

This requirement applies to certificates that are used and processed by the TSF and restricts the certificates that may be added as trusted CA certificates.

# A.4 Protection of the TSF (FPT)

# A.4.1 Internal TOE TSF data transfer (FPT ITT)

# A.4.1.1 FPT ITT.1 Basic internal TSF data transfer protection (Refinement)

## FPT ITT.1

## Basic internal TSF data transfer protection

**FPT\_ITT.1.1** The TSF shall protect TSF data from <u>disclosure and **detect its** modification</u> when it is transmitted between separate parts of the TOE **through the use of [selection:** *IPsec*, *SSH*, *TLS*, *DTLS*, *HTTPS*].

## **Application Note 45**

This requirement is only applicable to distributed TOEs, and ensures that all communications between components of the distributed TOE are protected through the use of an encrypted communications channel. The data passed in this trusted communication channel are encrypted as defined by the protocol chosen in the selection. The ST author should identify the channels and protocols used by each pair of communicating components in a distributed TOE, iterating this SFR as appropriate.

This channel may also be used as the registration channel for the registration process, as described in section 3.3 and FCO\_CPC\_EXT.1.2.

If TLS is selected, then the requirements to have the reference identifier established by the user (FCS\_TLSC\_EXT.1.2) are relaxed and the identifier may also be established through a "gatekeeper" discovery process. The TSS should describe the discovery process and highlight how the reference identifier is supplied to the "joining" component.

# A.5 Trusted Path/Channels (FTP)

## A.5.1 Trusted Path (FTP TRP)

## A.5.1.1 FTP TRP.1/Join Trusted Path (Refinement)

This iteration of FTP\_TRP.1 is defined as one of the options selectable for distributed TOE component registration in FCO\_CPC\_EXT.1 (section A.6.1).

## FTP TRP.1/Join Trusted Path

**FTP\_TRP.1.1/Join** The TSF shall provide a communication path between itself and a **joining component** [selection: remote, local] users that is logically distinct from other communication paths and provides assured identification of [selection: the TSF endpoint, both joining component and TSF endpoint] its end points and protection of the communicated data from modification [selection: and disclosure, none].

**FTP\_TRP.1.2/Join** The TSF shall permit [selection: *the TSF*, *the joining component* local users, remote users] to initiate communication via the trusted path.

**FTP\_TRP.1.3/Join** The TSF shall require the use of the trusted path for *joining components* to the TSF under environmental constraints identified in [assignment: reference to operational guidance].

# **Application Note 46**

This SFR implements one of the types of channel identified in the main selection for FCO\_CPC\_EXT.1.2. The "joining component" in FTP\_TRP.1/Join is the IT entity that is attempting to join the distributed TOE by using the registration process.

The effect of this SFR is to require the ability for components to communicate in a secure manner while the distributed TSF is being created (or when adding components to an existing distributed TSF). When creating the TSF from the initial pair of components, either of these components may be identified as the TSF for the purposes of satisfying the meaning of "TSF" in this SFR.

The selection at the end of FTP\_TRP.1.1/Join recognises that in some cases confidentiality (i.e. protection of the data from disclosure) may not be provided by the channel. The ST author distinguishes in the TSS whether in this case the TOE relies on the environment to provide confidentiality (as part of the constraints referenced in FTP\_TRP.1.3/Join) or whether the registration data exchanged does not require confidentiality (in which case this assertion must be justified). If "none" is selected, then this word may be omitted in the ST to improve readability.

The assignment in FTP\_TRP.1.3/Join ensures that the ST highlights any specific details needed to protect the registration environment.

Note that when the ST uses FTP\_TRP.1/Join for the registration channel then this channel cannot be reused as the normal inter-component communication channel (the latter channel must meet FTP ITC.1 or FPT ITT.1).

Specific requirements for Preparative Procedures relating to FTP\_TRP.1/Join are defined in the Evaluation Activities in [SD].

# A.6 Communication (FCO)

## A.6.1 Communication Partner Control (FCO CPC EXT)

The SFR in this section defines the top-level requirement for control over the way in which components are joined together under the control of a Security Administrator to create the distributed TOE (cf. section 3.3). The SFR makes use of references to other SFRs to define the lower-level characteristics of the types of channel that may be used in the registration process.

# A.6.1.1 FCO\_CPC\_EXT.1 Component Registration Channel Definition

# FCO CPC EXT.1 Component Registration Channel Definition

**FCO\_CPC\_EXT.1.1** The TSF shall require a Security Administrator to enable communications between any pair of TOE components before such communication can take place.

**FCO\_CPC\_EXT.1.2** The TSF shall implement a registration process in which components establish and use a communications channel that uses *[selection:* 

- A channel that meets the secure channel requirements in [selection: FTP\_ITC.1, FPT\_ITT.1],
- A channel that meets the secure registration channel requirements in FTP\_TRP.1/ Join.
- *No channel*]

for at least *TSF data*.

**FCO\_CPC\_EXT.1.3** The TSF shall enable a Security Administrator to disable communications between any pair of TOE components.

# **Application Note 47**

This SFR is only applicable if the TOE is distributed and therefore has multiple components that need to communicate via an internal TSF channel. When creating the TSF from the initial pair of components, either of these components may be identified as the TSF for the purposes of satisfying the meaning of "TSF" in this SFR.

The intention of this requirement is to ensure that there is a registration process that includes a positive enablement step by an Administrator before components joining a distributed TOE can communicate with the other components of the TOE and before the new component can act as part of the TSF. The registration process may itself involve communication with the joining component: many network devices use a bespoke process for this, and the security requirements for the "registration communication" are then defined in FCO\_CPC\_EXT.1.2. Use of this "registration communication" channel is not deemed inconsistent with the requirement of FCO\_CPC\_EXT.1.1 (i.e. the registration channel can be used before the enablement step, but only in order to complete the registration process).

The channel selection (for the registration channel) in FCO\_CPC\_EXT.1.2 is essentially a choice between the use of a normal secure channel that is equivalent to a channel used to communicate with external IT entities (FTP\_ITC.1) or existing TOE components (FPT\_ITT.1), or else a separate type of channel that is specific to registration (FTP\_TRP.1/Join). If the TOE does not require a communications channel for registration (e.g. because the registration is achieved entirely by configuration actions by an Administrator at each of the components) then the main selection in FCO\_CPC\_EXT.1.2 is completed with the "No channel" option.

If the ST author selects the FTP\_ITC.1/FPT\_ITT.1 channel type in the main selection in FCO\_CPC\_EXT.1.2 then the TSS identifies the relevant SFR iteration that specifies the channel used. If the ST author selects the FTP\_TRP.1/Join channel type, then the TOE Summary Specification (possibly with support from the operational guidance) describes details of the channel and the mechanisms that it uses (and describes how the registration process ensures that the channel can only be used by the intended joiner and gatekeeper). Note that the FTP\_TRP.1/Join channel type may require support from security measures in the operational environment (see the definition of FTP\_TRP.1/Join for details).

If the ST author selects the FTP\_ITC.1/FPT\_ITT.1 channel type in the main selection in FCO\_CPC\_EXT.1.2 then the ST identifies the registration channel as a separate iteration of FTP\_ITC.1 or FPT\_ITT.1 and gives the iteration identifier (e.g. "FPT\_ITT.1/Join") in an ST Application Note for FCO\_CPC\_EXT.1.

Note that the channel set up and used for registration may be adopted as a continuing internal communication channel (i.e. between different TOE components) provided that the channel meets the requirements of FTP\_ITC.1 or FPT\_ITT.1. Otherwise the registration channel is closed after use and a separate channel is used for the internal communications.

Specific requirements for Preparative Procedures relating to FCO\_CPC\_EXT.1 are defined in the Evaluation Activities in [SD].

# **B.**Selection-Based Requirements

As indicated in the introduction to this cPP, the baseline requirements (those that must be performed by the TOE or its underlying platform) are contained in the body of this cPP. There are additional requirements based on selections in the body of the cPP: if certain selections are made, then additional requirements below will need to be included.

# **B.1** Audit Events for Selection-Based SFRs

Requirement	Auditable Events	Additional Audit Record Contents
FAU GEN EXT.1	None	None
FAU STG EXT.3	None	None
FAU_STG_EXT.4	None	None
FCS_DTLSC_EXT.1	Failure to establish a DTLS session	Reason for failure
FCS_DTLSC_EXT.2	Failure to establish a DTLS session	Reason for failure
FCS_DTLSC_EXT.2	Detected replay attacks	Identity (e.g., source IP address) of the source of the replay attack.
FCS_DTLSS_EXT.1	Failure to establish a DTLS session	Reason for failure
FCS_DTLSS_EXT.1	Detected replay attacks	Identity (e.g., source IP address) of the source of the replay attack.
FCS_DTLSS_EXT.2	Failure to establish a DTLS session	Reason for failure
FCS_DTLSS_EXT.2	Detected replay attacks	Identity (e.g., source IP address) of the source of the replay attack.
FCS_HTTPS_EXT.1	Failure to establish a HTTPS Session.	Reason for failure
FCS_IPSEC_EXT.1	Failure to establish an IPsec SA.	Reason for failure
FCS_NTP_EXT.1	Configuration of a new time server Removal of configured time server	Identity if new/removed time server
FCS_SSHC_EXT.1	Failure to establish an SSH session	Reason for failure

FCS_SSHS_EXT.1	Failure to establish an SSH session	Reason for failure	
FCS_TLSC_EXT.1	Failure to establish a TLS Session	Reason for failure	
FCS_TLSC_EXT.2	Failure to establish a TLS Session	Reason for failure	
FCS_TLSS_EXT.1	Failure to establish a TLS Session	Reason for failure	
FCS_TLSS_EXT.2	Failure to establish a TLS Session	Reason for failure	
FIA_X509_EXT.1/Rev	Unsuccessful attempt to validate a certificate Any addition, replacement or removal of trust anchors in the TOE's trust store	Reason for failure of certificate validation Identification of certificates added, replaced or removed as trust anchor in the TOE's trust store	
FIA_X509_EXT.2	None	None	
FIA_X509_EXT.3	None.	None.	
FPT_TST_EXT.2	Failure of self-test	Reason for failure (including identifier of invalid certificate)	
FPT_TUD_EXT.2	Failure of update	Reason for failure (including identifier of invalid certificate)	
FMT_MOF.1/Services	None.	None.	
FMT_MTD.1/CryptoKeys	None.	None.	
FMT_MOF.1/AutoUpdate	None.	None.	
FMT_MOF.1/Functions	None.	None.	

Table 5: Selection-Based SFRs and Auditable Events

# **Application Note 48**

The audit event for FIA\_X509\_EXT.1/Rev is based on the TOE not being able to complete the certificate validation by ensuring the following:

- the presence of the basicConstraints extension and that the CA flag is set to TRUE for all CA certificates.
- Verification of the digital signature of the trusted hierarchical CA
- read/access the CRL or access the OCSP server (according to selections in the ST).

If any of these checks fails, then an audit event with the failure should be written to the audit log.

# **B.2 Security Audit (FAU)**

# **B.2.1** Security Audit Data Generation (Extended - FAU\_GEN\_EXT)

# **B.2.1.1FAU\_GEN\_EXT.1** Security Audit Data Generation for Distributed TOE component

This SFR needs to be added to the ST for evaluation of distributed TOEs and needs to be fulfilled in addition to the general SFRs on Security Audit Data Generation for all types of TOEs (distributed, non-distributed).

The TSF, understood here as the entire distributed system, has to satisfy all mandatory audit generation requirements. However, it is acceptable to not generate a certain type of audit records on a TOE component if this TOE component doesn't implement a specific subset of the TSF. For example, if some distributed component does not support direct administrative login, there is no need to demonstrate generation of audit records showing direct administrative login on this component.

# FAU GEN EXT.1

## **Security Audit Generation**

**FAU\_GEN\_EXT.1.1** The TSF shall be able to generate audit records for each TOE component. The audit records generated by the TSF of each TOE component shall include the subset of security relevant audit events which can occur on the TOE component.

## **Application Note 49**

The TOE must be able to generate audit records for each TOE component. Some TOE components of a distributed TOE might not implement the complete TSF of the overall TOE but only a subset of the TSF. The audit records for each TOE component need to cover all security relevant audit events according to the subset of the TSF implemented by this particular TOE component but not necessarily all security relevant audit events according to the TSF of the overall TOE. If a security-relevant event can occur on multiple TOE components, it needs to cause generation of an audit record uniquely identifying the component associated with the event. The ST author shall identify for each TOE component which of the overall required audit events defined in FAU\_GEN.1.1 are logged. The ST author may decide to do this by providing a corresponding table. The information provided needs to be in agreement with Table 1. The overall TOE needs to cover all auditable events listed in Table 2 (and Tables 4 and 5 as applicable to the overall TOE).

## **B.2.2** Security Audit Event Storage (Extended - FAU STG EXT)

## **B.2.2.1FAU STG EXT.3 Protected Local Audit Event Storage for Distributed TOEs**

This SFR needs to be added to the ST for evaluation of distributed TOEs which contain TOE components that are storing audit data locally. This SFR needs to be fulfilled in addition to the general SFRs on Protected Audit Event Storage for all types of TOEs (distributed, non-distributed).

# FAU\_STG\_EXT.3 Protected Local Audit Event Storage for Distributed TOEs

**FAU\_STG\_EXT.3.1** The TSF of each TOE component which stores security audit data locally shall perform the following actions when the local storage space for audit data is full: [assignment: table of components and for each component its action chosen according to the following: [selection: drop new audit data, overwrite previous audit records according to the following rule: [assignment: rule for overwriting previous audit records], [assignment: other action]]].

# **Application Note 50**

If a component of a distributed TOE collects data from other components and then forwards it to another component or external IT entity (cf. FAU\_STG\_EXT.1.1) then the operations in this SFR must be performed in a way to cover the storage space action(s) for all of the audit data that the TOE collects (i.e. not just for the data generated by the collecting component for itself).

It is acceptable for a TOE component to store audit information in multiple places (e.g. for redundancy), whether locally in the TOE component itself and in another TOE component, or in more than one other TOE component.

TOE components are not required to monitor or audit connectivity or network outages between TOE components. This aspect is covered by the assumption A.COMPONENTS RUNNING.

## **B.2.2.2FAU STG EXT.4 Protected Remote Audit Event Storage for Distributed TOEs**

This SFR needs to be added to the ST for evaluation of distributed TOEs which contain TOE components that aren't storing audit data locally but sending it to another TOE component for storage. This SFR needs to be fulfilled in addition to the general SFRs on Protected Audit Event Storage for all types of TOEs (distributed, non-distributed).

# FAU\_STG\_EXT.4 Protected Remote Audit Event Storage for Distributed TOEs

**FAU\_STG\_EXT.4.1** Each TOE component which does not store security audit data locally shall be able to buffer security audit data locally until it has been transferred to another TOE component that stores or forwards it. All transfer of audit records between TOE components shall use a protected channel according to [selection: FPT ITT.1, FTP ITC.1].

## Application Note 51

If a component of a distributed TOE collects data from other components and then forwards it to another component or external IT entity (cf. FAU\_STG\_EXT.1.1) then the operations in this SFR must be performed in a way to cover the storage space action(s) for all of the audit data that the TOE collects (i.e. not just for the data generated by the collecting component for itself).

It is acceptable for a TOE component to store audit information in multiple places (e.g. for redundancy), whether locally in the TOE component itself and in another TOE component, or in more than one other TOE component.

TOE components are not required to monitor or audit connectivity or network outages between TOE components. This aspect is covered by the assumption A.COMPONENTS RUNNING.

# **B.3** Cryptographic Support (FCS)

B.3.1 Cryptographic Protocols (Extended – FCS\_DTLSC\_EXT, FCS\_DTLSS\_EXT, FCS\_HTTPS\_EXT, FCS\_ IPSEC\_EXT, FCS\_NTP\_EXT, FCS\_SSHC\_EXT, FCS\_SSHS\_EXT, FCS\_TLSC\_EXT, FCS\_TLSS\_EXT)

# **B.3.1.1FCS DTLSC EXT & FCS DTLSS EXT DTLS Protocol**

Datagram TLS (DTLS) is not a required component of the NDcPP. If a TOE implements DTLS, a corresponding selection in FTP\_ITC.1, FTP\_TRP.1/Admin, or FPT\_ITT.1 should be made to define what the DTLS protocol is implemented to protect.

A TOE may act as the client, the server, or both in DTLS sessions. The requirement has been separated into DTLS Client (FCS\_DTLSC\_EXT) and DTLS Server (FCS\_DTLSS\_EXT) requirements to allow for these differences.

If the TOE acts as the client during the claimed DTLS sessions, the ST author should claim one of the FCS\_DTLSC\_EXT requirements. If the TOE only transmits application-layer data to an external entity using a trusted channel provided by DTLS, (i.e. transmits syslog over DTLS) then FCS\_DTLSC\_EXT.1 should be selected.

If the application layer communication is bi-directional, that is, the TOE both transmits and receives application data or is managed by the DTLS Server, then FCS\_DTLSC\_EXT.2 is required. FCS\_DTLSC\_EXT.2 requires the client must be capable of the following:

- Present a certificate to a DTLS Server for mutual authentication.
- Perform a selected action if a DTLS message from the DTLS Server contains an invalid Message Authentication Code (MAC).
- Detect replayed messages

To ensure audit requirements are properly met, a DTLS receiver may need to monitor the DTLS connection state at the application layer. When no data is received from a DTLS connection for a long time (where the application decides what "long" means), the receiver should send a close notify alert message and close the connection.

# FCS DTLSC EXT.1

## **DTLS Client Protocol**

**FCS\_DTLSC\_EXT.1.1** The TSF shall implement [selection: *DTLS 1.2 (RFC 6347), DTLS 1.0 (RFC 4347)*] supporting the following ciphersuites:

- [selection:
  - o TLS RSA WITH AES 128 CBC SHA as defined in RFC 3268
  - o TLS RSA WITH AES 256 CBC SHA as defined in RFC 3268
  - o TLS DHE RSA WITH AES 128 CBC SHA as defined in RFC 3268

```
o TLS DHE RSA WITH AES 256 CBC SHA as defined in RFC 3268
o TLS ECDHE RSA WITH AES 128 CBC SHA as defined in RFC 4492
o TLS ECDHE RSA WITH AES 256 CBC SHA as defined in RFC 4492
o TLS ECDHE ECDSA WITH AES 128 CBC SHA as defined in RFC 4492
o TLS ECDHE ECDSA WITH AES 256 CBC SHA as defined in RFC 4492
o TLS RSA WITH AES 128 CBC SHA256 as defined in RFC 5246
o TLS RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
o TLS DHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5246
o TLS DHE RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
o TLS RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
o TLS RSA WITH AES 256 GCM SHA384 as defined in RFC 5288
o TLS DHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
o TLS DHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5288
o TLS ECDHE ECDSA WITH AES 128 CBC SHA256 as defined in RFC 5289
o TLS ECDHE ECDSA WITH AES 256 CBC SHA384 as defined in RFC 5289
o TLS ECDHE ECDSA WITH AES 128 GCM SHA256 as defined in RFC 5289
o TLS ECDHE ECDSA WITH AES 256 GCM SHA384 as defined in RFC 5289
o TLS ECDHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5289
o TLS ECDHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5289
```

# **Application Note 52**

].

The ciphersuites to be tested in the evaluated configuration are limited by this requirement. The ST author should select the ciphersuites that are supported. Even though RFC 5246 and RFC 6347 mandate implementation of specific ciphers, there is no requirement to implement TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA in order to claim conformance to this cPP.

TLS\_ECDHE\_RSA\_WITH\_AES\_128\_CBC\_SHA256 as defined in RFC 5289
 TLS\_ECDHE\_RSA\_WITH\_AES\_256 CBC\_SHA384 as defined in RFC 5289

These requirements will be revisited as new DTLS versions are standardized by the IETF.

*In a future version of this cPP DTLS v1.2 will be required for all TOEs.* 

FCS\_DTLSC\_EXT.1.2 The TSF shall verify that the presented identifier matches the reference identifier according to RFC 6125 section 6.

## **Application Note 53**

The rules for verification of identity are described in Section 6 of RFC 6125. The reference identifier is established by the Administrator (e.g. entering a URL into a web browser or clicking a link), by configuration (e.g. configuring the name of a mail server or authentication server), or by an application (e.g. a parameter of an API) depending on the application service. Based on a singular reference identifier's source domain and application service type (e.g. HTTP, SIP, LDAP), the client establishes all reference identifiers which are acceptable, such as a Common Name for the Subject Name field of the certificate and a (case-insensitive) DNS name, URI name, and Service Name for the Subject Alternative Name field. The client then

compares this list of all acceptable reference identifiers to the presented identifiers in the DTLS server's certificate.

The preferred method for verification is the Subject Alternative Name using DNS names, URI names, or Service Names. Verification using the Common Name is required for the purposes of backwards compatibility. Additionally, support for use of IP addresses in the Subject Name or Subject Alternative name is discouraged as against best practices but may be implemented. Finally, the client should avoid constructing reference identifiers using wildcards. However, if the presented identifiers include wildcards, the client must follow the best practices regarding matching; these best practices are captured in the evaluation activity.

**FCS\_DTLSC\_EXT.1.3** When establishing a trusted channel, by default the TSF shall not establish a trusted channel if the server certificate is invalid. The TSF shall also [selection:

- Not implement any administrator override mechanism
- require administrator authorization to establish the connection if the TSF fails to [selection: match the reference identifier, validate certificate path, validate expiration date, determine the revocation status] of the presented server certificate

].

# **Application Note 54**

"Revocation status" refers to a OCSP or CRL response that indicates the presented certificate is invalid. Inability to make a connection to determine validity shall be handled as specified in FIA X509 EXT.2.2.

If DTLS is selected in FTP\_ITC then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/Rev.

If DTLS is selected in FPT\_ITT, then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/ITT.

**FCS\_DTLSC\_EXT.1.4** The TSF shall [selection: not present the Supported Elliptic Curves Extension, present the Supported Elliptic Curves Extension with the following NIST curves: [selection: secp256r1, secp384r1, secp521r1] and no other curves] in the Client Hello.

## **Application Note 55**

If ciphersuites with elliptic curves were selected in FCS\_DTLSC\_EXT.1.1, a selection of one or more curves is required. If no ciphersuites with elliptic curves were selected in FCS\_DTLSC\_EXT.1.1, then "not present the Supported Elliptic Curves Extension" should be selected.

This requirement limits the elliptic curves allowed for authentication and key agreement to the NIST curves from FCS\_COP.1/SigGen and FCS\_CKM.1 and FCS\_CKM.2. This extension is required for clients supporting Elliptic Curve ciphersuites.

## FCS DTLSC EXT.2

## DTLS Client Protocol - with authentication

**FCS\_DTLSC\_EXT.2.1** The TSF shall implement [selection: *DTLS 1.2 (RFC 6347), DTLS 1.0 (RFC 4347)*] supporting the following ciphersuites:

## • [selection:

- o TLS RSA WITH AES 128 CBC SHA as defined in RFC 3268
- o TLS RSA WITH AES 256 CBC SHA as defined in RFC 3268
- o TLS DHE RSA WITH AES 128 CBC SHA as defined in RFC 3268
- o TLS DHE RSA WITH AES 256 CBC SHA as defined in RFC 3268
- o TLS\_ECDHE\_RSA\_WITH\_AES\_128\_CBC\_SHA as defined in RFC 4492
- o TLS ECDHE RSA WITH AES 256 CBC SHA as defined in RFC 4492
- o TLS ECDHE ECDSA WITH AES 128 CBC SHA as defined in RFC 4492
- o TLS ECDHE ECDSA WITH AES 256 CBC SHA as defined in RFC 4492
- o TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA256 as defined in RFC 5246
- o TLS RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
- o TLS DHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5246
- o TLS DHE RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
- o TLS RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
- o TLS\_RSA\_WITH\_AES\_256\_GCM\_SHA384 as defined in RFC 5288
- o TLS DHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
- o TLS DHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5288
- o TLS ECDHE ECDSA WITH AES 128 CBC SHA256 as defined in RFC 5289
- o TLS ECDHE ECDSA WITH AES 256 CBC SHA384 as defined in RFC 5289
- o TLS ECDHE ECDSA WITH AES 128 GCM SHA256 as defined in RFC 5289
- o TLS ECDHE ECDSA WITH AES 256 GCM SHA384 as defined in RFC 5289
- o TLS ECDHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5289
- o TLS ECDHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5289
- o TLS ECDHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5289
- o TLS ECDHE RSA WITH AES 256 CBC SHA384 as defined in RFC 5289

7.

## **Application Note 56**

The ciphersuites to be tested in the evaluated configuration are limited by this requirement. The ST author should select the ciphersuites that are supported. Even though RFC 5246 and RFC 6347 mandate implementation of specific ciphers, there is no requirement to implement TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA in order to claim conformance to this cPP.

These requirements will be revisited as new DTLS versions are standardized by the IETF.

In a future version of this cPP DTLS v1.2 will be required for all TOEs

FCS\_DTLSC\_EXT.2.2 The TSF shall verify that the presented identifier matches the reference identifier according to RFC 6125 section 6.

## **Application Note 57**

The rules for verification of identity are described in Section 6 of RFC 6125. The reference identifier is established by the Administrator (e.g. entering a URL into a web browser or clicking a link), by configuration (e.g. configuring the name of a mail server or authentication server), or by an application (e.g. a parameter of an API) depending on the application service.

Based on a singular reference identifier's source domain and application service type (e.g. HTTP, SIP, LDAP), the client establishes all reference identifiers which are acceptable, such as a Common Name for the Subject Name field of the certificate and a (case-insensitive) DNS name, URI name, and Service Name for the Subject Alternative Name field. The client then compares this list of all acceptable reference identifiers to the presented identifiers in the DTLS server's certificate.

The preferred method for verification is the Subject Alternative Name using DNS names, URI names, or Service Names. Verification using the Common Name is required for the purposes of backwards compatibility. Additionally, support for use of IP addresses in the Subject Name or Subject Alternative name is discouraged as against best practices but may be implemented. Finally, the client should avoid constructing reference identifiers using wildcards. However, if the presented identifiers include wildcards, the client must follow the best practices regarding matching; these best practices are captured in the evaluation activity.

FCS\_DTLSC\_EXT.2.3 When establishing a trusted channel, by default the TSF shall not establish a trusted channel if the server certificate is invalid. The TSF shall also [selection:

- Not implement any administrator override mechanism
- require administrator authorization to establish the connection if the TSF fails to [selection: match the reference identifier, validate certificate path, validate expiration date, determine the revocation status] of the presented server certificate

].

# **Application Note 58**

"Revocation status" refers to a OCSP or CRL response that indicates the presented certificate is invalid. Inability to make a connection to determine validity shall be handled as specified in FIA X509 EXT.2.2.

If DTLS is selected in FTP\_ITC then certificate validity is tested in accordance with testing performed for FIA\_X509\_EXT.1/Rev.

If DTLS is selected in FPT\_ITT, then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/ITT.

**FCS\_DTLSC\_EXT.2.4** The TSF shall [selection: not present the Supported Elliptic Curves Extension, present the Supported Elliptic Curves Extension with the following NIST curves: [selection: secp256r1, secp384r1, secp521r1] and no other curves] in the Client Hello.

## **Application Note 59**

If ciphersuites with elliptic curves were selected in FCS\_DTLSC\_EXT.2.1, a selection of one or more curves is required. If no ciphersuites with elliptic curves were selected in FCS\_DTLSC\_EXT.2.1, then "not present the Supported Elliptic Curves Extension" should be selected.

This requirement limits the elliptic curves allowed for authentication and key agreement to the NIST curves from FCS\_COP.1/SigGen and FCS\_CKM.1 and FCS\_CKM.2. This extension is required for clients supporting Elliptic Curve ciphersuites.

FCS\_DTLSC\_EXT.2.5 The TSF shall support mutual authentication using X.509v3 certificates.

## Application Note 60

The use of X.509v3 certificates for DTLS is addressed in FIA\_X509\_EXT.2.1. This requirement adds that the client must be capable of presenting a certificate to a DTLS server for DTLS mutual authentication.

**FCS\_DTLSC\_EXT.2.6** The TSF shall [selection: *terminate the DTLS session, silently discard the record*] if a message received contains an invalid MAC.

## **Application Note 61**

The Message Authentication Code (MAC) is negotiated during DTLS handshake phase and is used to protect integrity of messages received from the sender during DTLS data exchange. If MAC verification fails, the session must be terminated or the record must be silently discarded.

FCS DTLSC EXT.2.7 The TSF shall detect and silently discard replayed messages for:

- DTLS records previously received.
- DTLS records too old to fit in the sliding window.

## Application Note 62

Replay Detection is described in section 4.1.2.6 of DTLS 1.2 (RFC 6347) and section 4.1.2.5 of DTLS 1.0 (RFC 4347). For each received record, the receiver verifies the record contains a sequence number that is within the sliding receive window and does not duplicate the sequence number of any other record received during the session.

"Silently Discard" means the TOE discards the packet without responding.

## FCS DTLSS EXT.1

## **DTLS Server Protocol**

FCS\_DTLSS\_EXT.1.1 The TSF shall implement [selection: *DTLS 1.2 (RFC 6347), DTLS 1.0 (RFC 4347)*] supporting the following ciphersuites:

- [selection:
  - o TLS RSA WITH AES 128 CBC SHA as defined in RFC 3268
  - o TLS RSA WITH AES 256 CBC SHA as defined in RFC 3268
  - o TLS DHE RSA WITH AES 128 CBC SHA as defined in RFC 3268
  - o TLS DHE RSA WITH AES 256 CBC SHA as defined in RFC 3268
  - o TLS ECDHE RSA WITH AES 128 CBC SHA as defined in RFC 4492
  - o TLS ECDHE RSA WITH AES 256 CBC SHA as defined in RFC 4492
  - o TLS ECDHE ECDSA WITH AES 128 CBC SHA as defined in RFC 4492
  - o TLS ECDHE ECDSA WITH AES 256 CBC SHA as defined in RFC 4492
  - o TLS RSA WITH AES 128 CBC SHA256 as defined in RFC 5246
  - o TLS RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
  - o TLS DHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5246

- o TLS DHE RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
- o TLS RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
- o TLS RSA WITH AES 256 GCM SHA384 as defined in RFC 5288
- o TLS DHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
- o TLS DHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5288
- o TLS ECDHE ECDSA WITH AES 128 CBC SHA256 as defined in RFC 5289
- o TLS ECDHE ECDSA WITH AES 256 CBC SHA384 as defined in RFC 5289
- o TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_GCM\_SHA256 as defined in RFC 5289
- o TLS ECDHE ECDSA WITH AES 256 GCM SHA384 as defined in RFC 5289
- o TLS ECDHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5289
- o TLS ECDHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5289
- o TLS ECDHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5289
- o TLS\_ECDHE\_RSA\_WITH\_AES\_256\_CBC\_SHA384 as defined in RFC 5289

].

# **Application Note 63**

The ciphersuites to be tested in the evaluated configuration are limited by this requirement. The ST author should select the ciphersuites that are supported. Even though RFC 5246 and RFC 6347 mandate implementation of specific ciphers, there is no requirement to implement TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA in order to claim conformance to this cPP.

These requirements will be revisited as new DTLS versions are standardized by the IETF.

*In a future version of this cPP DTLS v1.2 will be required for all TOEs.* 

FCS DTLSS EXT.1.2 The TSF shall deny connections from clients requesting *none*.

## Application Note 64

This version of the cPP does not require the TOE to deny DTLS v1.0. In a future version of this cPP DTLS v1.0 will be required to be denied for all TOEs.

**FCS\_DTLSS\_EXT.1.3** The TSF shall not proceed with a connection handshake attempt if the DTLS Client fails validation.

## **Application Note 65**

The process to validate the DTLS client is specified in section 4.2.1 of RFC 6347 (DTLS 1.2) and RFC 4347 (DTLS 1.0). The TOE validates the DTLS client during Connection Establishment (Handshaking) and prior to the TSF sending a Server Hello message. After receiving a ClientHello, the DTLS Server sends a HelloVerifyRequest along with a cookie. The cookie is a signed message using the keyed hash function specified in FCS\_COP.1/KeyedHash. The DTLS Client then sends another ClientHello with the cookie attached. If the DTLS server successfully verifies the signed cookie, the Client is not using a spoofed IP address.

**FCS\_DTLSS\_EXT.1.4** The TSF shall [selection: perform RSA key establishment with key size [selection: 2048 bits, 3072 bits, 4096 bits]; generate EC Diffie-Hellman parameters over NIST

curves [selection: secp256r1, secp384r1, secp521r1] and no other curves; generate Diffie-Hellman parameters of size [selection: 2048 bits, 3072 bits]].

## **Application Note 66**

If the ST lists a DHE or ECDHE ciphersuite in FCS\_DTLSS\_EXT.1.1, the ST must include the Diffie-Hellman or NIST curves selection in the requirement. FMT\_SMF.1 requires the configuration of the key agreement parameters to establish the security strength of the DTLS connection.

**FCS\_DTLSS\_EXT.1.5** The TSF shall [selection: *terminate the DTLS session, silently discard the record*] if a message received contains an invalid MAC.

# **Application Note 67**

The Message Authentication Code (MAC) is negotiated during DTLS handshake phase and is used to protect integrity of messages received from the sender during DTLS data exchange. If MAC verification fails, the session must be terminated or the record must be silently discarded.

FCS DTLSS EXT.1.6 The TSF shall detect and silently discard replayed messages for:

- DTLS records previously received.
- DTLS records too old to fit in the sliding window.

## **Application Note 68**

Replay Detection is described in section 4.1.2.6 of DTLS 1.2 (RFC 6347) and section 4.1.2.5 of DTLS 1.0 (RFC 4347). For each received record, the receiver verifies the record contains a sequence number that is within the sliding receive window and does not duplicate the sequence number of any other record received during the session.

"Silently Discard" means the TOE discards the packet without responding.

## FCS DTLSS EXT.2 DTLS Server Protocol with mutual authentication

**FCS\_DTLSS\_EXT.2.1** The TSF shall implement [selection: *DTLS 1.2 (RFC 6347), DTLS 1.0 (RFC 4347)*] supporting the following ciphersuites:

- [selection:
  - o TLS RSA WITH AES 128 CBC SHA as defined in RFC 3268
  - o TLS RSA WITH AES 256 CBC SHA as defined in RFC 3268
  - o TLS DHE RSA WITH AES 128 CBC SHA as defined in RFC 3268
  - o TLS DHE RSA WITH AES 256 CBC SHA as defined in RFC 3268
  - o TLS\_ECDHE\_RSA\_WITH\_AES\_128\_CBC\_SHA as defined in RFC 4492
  - o TLS ECDHE RSA WITH AES 256 CBC SHA as defined in RFC 4492
  - o TLS ECDHE ECDSA WITH AES 128 CBC SHA as defined in RFC 4492
  - o TLS ECDHE ECDSA WITH AES 256 CBC SHA as defined in RFC 4492
  - o TLS RSA WITH AES 128 CBC SHA256 as defined in RFC 5246

- o TLS RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
- o TLS DHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5246
- o TLS DHE RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
- o TLS RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
- o TLS RSA WITH AES 256 GCM SHA384 as defined in RFC 5288
- o TLS DHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
- o TLS DHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5288
- o TLS ECDHE ECDSA WITH AES 128 CBC SHA256 as defined in RFC 5289
- o TLS ECDHE ECDSA WITH AES 256 CBC SHA384 as defined in RFC 5289
- o TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_GCM\_SHA256 as defined in RFC 5289
- o TLS ECDHE ECDSA WITH AES 256 GCM SHA384 as defined in RFC 5289
- o TLS ECDHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5289
- o TLS\_ECDHE\_RSA\_WITH\_AES\_256\_GCM\_SHA384 as defined in RFC 5289
- o TLS ECDHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5289
- o TLS ECDHE RSA WITH AES 256 CBC SHA384 as defined in RFC 5289

].

## **Application Note 69**

The ciphersuites to be tested in the evaluated configuration are limited by this requirement. The ST author should select the ciphersuites that are supported. Even though RFC 5246 and RFC 6347 mandate implementation of specific ciphers, there is no requirement to implement TLS RSA WITH AES 128 CBC SHA in order to claim conformance to this cPP.

These requirements will be revisited as new DTLS versions are standardized by the IETF.

*In a future version of this cPP DTLS v1.2 will be required for all TOEs.* 

FCS DTLSS EXT.2.2 The TSF shall deny connections from clients requesting *none*.

## Application Note 70

This version of the cPP does not require the TOE to deny DTLS v1.0. In a future version of this cPP DTLS v1.0 will be required to be denied for all TOEs.

FCS\_DTLSS\_EXT.2.3 The TSF shall not proceed with a connection handshake attempt if the DTLS Client fails validation.

## Application Note 71

The process to validate the DTLS client is specified in section 4.2.1 of RFC 6347 (DTLS 1.2) and RFC 4347 (DTLS 1.0). The TOE validates the DTLS client during Connection Establishment (Handshaking) and prior to the TSF sending a Server Hello message. After receiving a ClientHello, the DTLS Server sends a HelloVerifyRequest along with a cookie. The cookie is a signed message using the keyed hash function specified in FCS\_COP.1/KeyedHash. The DTLS Client then sends another ClientHello with the cookie attached. If the DTLS server successfully verifies the signed cookie, the Client is not using a spoofed IP address.

FCS\_DTLSS\_EXT.2.4 The TSF shall [selection: perform RSA key establishment with key size [selection: 2048 bits, 3072 bits, 4096 bits]; generate EC Diffie-Hellman parameters over NIST

curves [selection: secp256r1, secp384r1, secp521r1] and no other curves; generate Diffie-Hellman parameters of size [selection: 2048 bits, 3072 bits]].

## Application Note 72

If the ST lists a DHE or ECDHE ciphersuite in FCS\_DTLSS\_EXT.2.1, the ST must include the Diffie-Hellman or NIST curves selection in the requirement. FMT\_SMF.1 requires the configuration of the key agreement parameters in order to establish the security strength of the DTLS connection.

**FCS\_DTLSS\_EXT.2.5** The TSF shall [selection: *terminate the DTLS session, silently discard the record*] if a message received contains an invalid MAC.

## Application Note 73

The Message Authentication Code (MAC) is negotiated during the DTLS handshake phase and is used to protect integrity of messages received from the sender during DTLS data exchange. If MAC verification fails, the session must be terminated or the record must be silently discarded.

FCS DTLSS EXT.2.6 The TSF shall detect and silently discard replayed messages for:

- DTLS records previously received.
- DTLS records too old to fit in the sliding window.

## Application Note 74

Replay Detection is described in section 4.1.2.6 of DTLS 1.2 (RFC 6347) and section 4.1.2.5 of DTLS 1.0 (RFC 4347). For each received record, the receiver verifies the record contains a sequence number that is within the sliding receive window and does not duplicate the sequence number of any other record received during the session.

"Silently Discard" means the TOE discards the packet without responding.

FCS\_DTLSS\_EXT.2.7 The TSF shall support mutual authentication of DTLS clients using X.509v3 certificates.

## Application Note 75

The use of X.509v3 certificates for DTLS is addressed in FIA\_X509\_EXT.2.1. This requirement adds that this use must include support for client-side certificates for DTLS mutual authentication.

FCS\_DTLSS\_EXT.2.8 When establishing a trusted channel, by default the TSF shall not establish a trusted channel if the client certificate is invalid. The TSF shall also [selection:

- Not implement any administrator override mechanism
- require administrator authorization to establish the connection if the TSF fails to [selection: match the reference identifier, validate certificate path, validate expiration date, determine the revocation status] of the presented client certificate

].

## Application Note 76

"Revocation status" refers to a OCSP or CRL response that indicates the presented certificate is invalid. Inability to make a connection to determine validity shall be handled as specified in FIA X509 EXT.2.2.

If DTLS is selected in FTP\_ITC then certificate validity is tested in accordance with testing performed for FIA\_X509\_EXT.1/Rev.

If DTLS is selected in FPT\_ITT, then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/ITT.

FCS\_DTLSS\_EXT.2.9 The TSF shall not establish a trusted channel if the distinguished name (DN) or Subject Alternative Name (SAN) contained in a certificate does not match the expected identifier for the client.

# Application Note 77

The client identifier may be in the Subject field or the Subject Alternative Name extension of the certificate. The expected identifier may either be configured, may be compared to the Domain Name, IP address, username, or email address used by the peer, or may be passed to a directory server for comparison.

## **B.3.1.2 FCS\_HTTPS\_EXT HTTPS Protocol**

HTTPS is not a required component of this cPP. If a TOE implements HTTPS, a corresponding selection in FTP\_ITC.1, FPT\_ITT.1 and/or FTP\_TRP.1/Admin should have been made that defines what the HTTPS protocol is implemented to protect.

## FCS HTTPS EXT.1

## **HTTPS Protocol**

**FCS\_HTTPS\_EXT.1.1** The TSF shall implement the HTTPS protocol that complies with RFC 2818.

## **Application Note 78**

The ST author must provide enough detail to determine how the implementation is complying with the standard(s) identified; this can be done by additional detail in the TSS.

FCS\_HTTPS\_EXT.1.2 The TSF shall implement HTTPS using TLS.

**FCS\_HTTPS\_EXT.1.3** If a peer certificate is presented, the TSF shall [selection: not require client authentication, not establish the connection, request authorization to establish the connection, [assignment: other action] if the peer certificate is deemed invalid.

# **Application Note 79**

If HTTPS is selected in FTP\_TRP.1/Admin or FTP\_ITC.1 then validity is determined by the identifier verification, certification path, the expiration date, and the revocation status in accordance with RFC 5280. Certificate validity is tested in accordance with testing performed for FIA\_X509\_EXT.1/Rev. If HTTPS is selected in FPT\_ITT.1 then certificate validity is tested in accordance with testing performed for FIA\_X509\_EXT.1/ITT.

## **B.3.1.3 FCS IPSEC EXT.1 IPsec Protocol**

The endpoints of network device communication can be geographically and logically distant and may pass through a variety of other potentially untrusted systems. The security functionality of the network device must be able to protect any critical network traffic (administration traffic, authentication traffic, audit traffic, etc.). One way to provide a mutually authenticated communication channel between the network device and an external IT entity is to implement IPsec.

IPsec is not a required component of this cPP. If a TOE implements IPsec, a corresponding selection in FTP\_ITC.1, FPT\_ITT.1 and/or FTP\_TRP.1/Admin should have been made that defines what the IPsec protocol is implemented to protect.

IPsec is a peer to peer protocol and as such does not need to be separated into client and server requirements.

## FCS IPSEC EXT.1 IPsec Protocol

**FCS\_IPSEC\_EXT.1.1** The TSF shall implement the IPsec architecture as specified in RFC 4301.

## Application Note 80

RFC 4301 calls for an IPsec implementation to protect IP traffic through the use of a Security Policy Database (SPD). The SPD is used to define how IP packets are to be handled: PROTECT the packet (e.g., encrypt the packet), BYPASS the IPsec services (e.g., no encryption), or DISCARD the packet (e.g., drop the packet). The SPD can be implemented in various ways, including router access control lists, firewall rulesets, a "traditional" SPD, etc. Regardless of the implementation details, there is a notion of a "rule" that a packet is "matched" against and a resulting action that takes place.

While there must be a means to order the rules, a general approach to ordering is not mandated, as long as the SPD can distinguish the IP packets and apply the rules accordingly. There may be multiple SPDs (one for each network interface), but this is not required.

FCS\_IPSEC\_EXT.1.2 The TSF shall have a nominal, final entry in the SPD that matches anything that is otherwise unmatched, and discards it.

**FCS IPSEC EXT.1.3** The TSF shall implement [selection: transport mode, tunnel mode].

## **Application Note 81**

*The ST author selects the supported modes of operation for IPsec.* 

FCS\_IPSEC\_EXT.1.4 The TSF shall implement the IPsec protocol ESP as defined by RFC 4303 using the cryptographic algorithms [selection: AES-CBC-128, AES-CBC-192, AES-CBC-256 (specified in RFC 3602), no other algorithm] together with a Secure Hash Algorithm (SHA)-based HMAC [selection: HMAC-SHA-1, HMAC-SHA-256, HMAC-SHA-384, HMAC-SHA-512, no other algorithm] and [selection: AES-GCM-128, AES-GCM-192, AES-GCM-256 (specified in RFC 4106), no other algorithm].

## **Application Note 82**

When an AES-CBC algorithm is selected, at least one SHA-based HMAC must also be chosen. If only an AES-GCM algorithm is selected, then a SHA-based HMAC is not required since AES-GCM satisfies both confidentiality and integrity functions. IPsec may utilise a truncated version of the SHA-based HMAC functions contained in the selections. Where a truncated output is utilised, it shall be highlighted in the TSS.

# **FCS\_IPSEC\_EXT.1.5** The TSF shall implement the protocol: [selection:

- IKEv1, using Main Mode for Phase 1 exchanges, as defined in RFCs 2407, 2408, 2409, RFC 4109, [selection: no other RFCs for extended sequence numbers, RFC 4304 for extended sequence numbers], and [selection: no other RFCs for hash functions, RFC 4868 for hash functions];
- IKEv2 as defined in RFC 5996 and [selection: with no support for NAT traversal, with mandatory support for NAT traversal as specified in RFC 5996, section 2.23)], and [selection: no other RFCs for hash functions, RFC 4868 for hash functions]

].

## **Application Note 83**

If the TOE implements SHA-2 hash algorithms for IKEv1 or IKEv2, the ST author selects RFC 4868. If the TOE implements the use of truncated SHA-based HMACs as described in RFC 4868, they shall be highlighted in the TSS.

**FCS\_IPSEC\_EXT.1.6** The TSF shall ensure the encrypted payload in the [selection: *IKEv1*, *IKEv2*] protocol uses the cryptographic algorithms [selection: *AES-CBC-128*, *AES-CBC-192*, *AES-CBC-256* (specified in RFC 3602), AES-GCM-128, AES-GCM-192, AES-GCM-256 (specified in RFC 5282)].

## **Application Note 84**

AES-GCM-128, AES-GCM-192 and AES-GCM-256 may only be selected if IKEv2 is also selected, as there is no RFC defining AES-GCM for IKEv1.

## **FCS IPSEC EXT.1.7** The TSF shall ensure that [selection:

- *IKEv1 Phase 1 SA lifetimes can be configured by a Security Administrator based on [selection:* 
  - o *number of bytes*;
  - o length of time, where the time values can be configured within [assignment: integer range including 24] hours;

];

- *IKEv2 SA lifetimes can be configured by a Security Administrator based on* [selection:
  - o number of bytes;
  - o length of time, where the time values can be configured within [assignment: integer range including 24] hours

 $\int$ 

].

## **Application Note 85**

The ST author chooses either the IKEv1 requirements or IKEv2 requirements (or both, depending on the selection in FCS\_IPSEC\_EXT.1.5). The ST author chooses either volume-based lifetimes or time-based lifetimes (or a combination). This requirement must be accomplished by providing Security Administrator-configurable lifetimes (with appropriate instructions in documents mandated by AGD\_OPE). Hardcoded limits do not meet this requirement. In general, instructions for setting the parameters of the implementation, including lifetime of the SAs, should be included in the guidance documentation generated for AGD\_OPE.

# FCS\_IPSEC\_EXT.1.8 The TSF shall ensure that [selection:

- *IKEv1 Phase 2 SA lifetimes can be configured by a Security Administrator based on [selection:* 
  - o number of bytes;
  - o length of time, where the time values can be configured within [assignment: integer range including 8] hours;

];

- IKEv2 Child SA lifetimes can be configured by a Security Administrator based on [selection:
  - o number of bytes;
  - o length of time, where the time values can be configured within [assignment: integer range including 8] hours;

].

## **Application Note 86**

]

The ST author chooses either the IKEv1 requirements or IKEv2 requirements (or both, depending on the selection in FCS\_IPSEC\_EXT.1.5). The ST author chooses either volume-based lifetimes or time-based lifetimes (or a combination). This requirement must be accomplished by providing Security Administrator-configurable lifetimes (with appropriate instructions in documents mandated by AGD\_OPE). Hardcoded limits do not meet this requirement. In general, instructions for setting the parameters of the implementation, including lifetime of the SAs, should be included in the guidance documentation generated for AGD\_OPE.

**FCS\_IPSEC\_EXT.1.9** The TSF shall generate the secret value x used in the IKE Diffie-Hellman key exchange ("x" in g^x mod p) using the random bit generator specified in FCS\_RBG\_EXT.1, and having a length of at least [assignment: (one or more) number(s) of bits that is at least twice the security strength of the negotiated Diffie-Hellman group] bits.

## **Application Note 87**

For DH groups 19 and 20, the "x" value is the point multiplier for the generator point G.

Since the implementation may allow different Diffie-Hellman groups to be negotiated for use in forming the SAs, the assignment in FCS IPSEC EXT.1.9 may contain multiple values. For

each DH group supported, the ST author consults Table 2 in NIST SP 800-57 "Recommendation for Key Management –Part 1: General" to determine the security strength ("bits of security") associated with the DH group. Each unique value is then used to fill in the assignment for this element. For example, suppose the implementation supports DH group 14 (2048-bit MODP) and group 20 (ECDH using NIST curve P-384). From Table 2, the bits of security value for group 14 is 112, and for group 20 is 192.

**FCS\_IPSEC\_EXT.1.10** The TSF shall generate nonces used in [selection: *IKEv1*, *IKEv2*] exchanges of length [selection:

- according to the security strength associated with the negotiated Diffie-Hellman group;
- at least 128 bits in size and at least half the output size of the negotiated pseudorandom function (PRF) hash
  1.

# **Application Note 88**

The ST author must select the second option for nonce lengths if IKEv2 is also selected (as this is mandated in RFC 5996). The ST author may select either option for IKEv1.

For the first option for nonce lengths, since the implementation may allow different Diffie-Hellman groups to be negotiated for use in forming the SAs, the assignment in FCS\_IPSEC\_EXT.1.10 may contain multiple values. For each DH group supported, the ST author consults Table 2 in NIST SP 800-57 "Recommendation for Key Management —Part 1: General" to determine the security strength ("bits of security") associated with the DH group. Each unique value is then used to fill in the assignment for this element. For example, suppose the implementation supports DH group 14 (2048-bit MODP) and group 20 (ECDH using NIST curve P-384). From Table 2, the bits of security value for group 14 is 112, and for group 20 it is 192.

Because nonces may be exchanged before the DH group is negotiated, the nonce used should be large enough to support all TOE-chosen proposals in the exchange.

FCS\_IPSEC\_EXT.1.11 The TSF shall ensure that IKE protocols implement DH Group(s) [selection: 14 (2048-bit MODP), 19 (256-bit Random ECP), 20 (384-bit Random ECP), 24 (2048-bit MODP with 256-bit POS)].

## **Application Note 89**

The selection is used to specify additional DH groups supported. This applies to IKEv1 and IKEv2 exchanges.

**FCS\_IPSEC\_EXT.1.12** The TSF shall be able to ensure by default that the strength of the symmetric algorithm (in terms of the number of bits in the key) negotiated to protect the [selection: *IKEv1 Phase 1, IKEv2 IKE\_SA*] connection is greater than or equal to the strength of the symmetric algorithm (in terms of the number of bits in the key) negotiated to protect the [selection: *IKEv1 Phase 2, IKEv2 CHILD\_SA*] connection.

## **Application Note 90**

The ST author chooses either or both of the IKE selections based on what is implemented by the TOE. Obviously, the IKE version(s) chosen should be consistent not only in this element,

but with other choices for other elements in this component. While it is acceptable for this capability to be configurable, the default configuration in the evaluated configuration (either "out of the box" or by configuration guidance in the AGD documentation) must enable this functionality.

**FCS\_IPSEC\_EXT.1.13** The TSF shall ensure that all IKE protocols perform peer authentication using [selection: *RSA*, *ECDSA*] that use X.509v3 certificates that conform to RFC 4945 and [selection: *Pre-shared Keys, no other method*].

## **Application Note 91**

At least one public-key-based Peer Authentication method is required in order to conform to this cPP; one or more of the public key schemes is chosen by the ST author to reflect what is implemented. The ST author also ensures that appropriate FCS requirements reflecting the algorithms used (and key generation capabilities, if provided) are listed to support those methods. Note that the TSS will elaborate on the way in which these algorithms are to be used (for example, RFC 2409 specifies three authentication methods using public keys; each one supported will be described in the TSS).

**FCS\_IPSEC\_EXT.1.14** The TSF shall only establish a trusted channel if the presented identifier in the received certificate matches the configured reference identifier, where the presented and reference identifiers are of the following fields and types: [selection: *SAN: IP address, SAN: Fully Qualified Domain Name (FQDN), SAN: user FQDN, CN: IP address, CN: Fully Qualified Domain Name (FQDN), CN: user FQDN, Distinguished Name (DN)] and [selection: no other reference identifier type, [assignment: other supported reference identifier types]*].

## Application Note 92

When using RSA or ECDSA certificates for peer authentication, the reference and presented identifiers take the form of either a DN, IP address, FQDN or user FQDN. The reference identifier is the identifier the TOE expects to receive from the peer during IKE authentication. The presented identifier is the identifier that is contained within the peer certificate body. The ST author shall select the presented and reference identifier types supported and may optionally assign additional supported identifier types in the second selection. Excluding the DN identifier type (which is necessarily the Subject DN in the peer certificate), the TOE may support the identifier in either the Common Name or Subject Alternative Name (SAN) or both.

The critical requirement of X.509 identifiers is the ability to bind the public key uniquely to an identity. This can be achieved by using strongly-typed identifiers or controlling the CA and certificate issuance. One recommended method for identity verification is supporting the use of the Subject Alternative Name (SAN) extension using DNS names, URI names, or Service Names. However, the support for a SAN extension is optional as long as identifier uniqueness can be achieved by other means.

In a future version of this cPP, SAN and/or DN support might be required for all TOEs, support for CN might be optional, and the "other supported referenced identifier types" selection might be removed. In a future version of this cPP, it might also be required that the SAN (when present) shall take precedence over CN.

Supported peer certificate algorithms are the same as FCS IPSEC EXT.1.13

## **B.3.1.4 FCS NTP EXT Protocol**

This is a selection-based SFR, to be included in the ST if "synchronise time with an NTP Server" is selected within FPT STM EXT.1.2.

This SFR is not applicable if the TOE cannot be configured to operate as an NTP time recipient (client or peer), even if the TOE can operate as an NTP time source (server or peer) for non-TOE entities. Such communications could potentially be listed as a capability within FTP ITC.1.

## FCS NTP EXT.1

## **NTP Protocol**

**FCS\_NTP\_EXT.1.1** The TSF shall use only the following NTP version(s) [selection: *NTP v3* (*RFC 1305*), *NTP v4* (*RFC 5905*)].

FCS NTP EXT.1.2 The TSF shall update its system time using [selection:

- Authentication using [selection: <u>SHA1, SHA256, SHA384, SHA512, AES-CBC-128, AES-CBC-256</u>] as the message digest algorithm(s);
- [selection: <u>IPsec, DTLS</u>] to provide trusted communication between itself and an NTP time source.

].

FCS\_NTP\_EXT.1.3 The TSF shall not update NTP timestamp from broadcast and/or multicast addresses.

FCS\_NTP\_EXT.1.4 The TSF shall support configuration of at least three (3) NTP time sources.

## **Application Note 93**

The TOE has to support configuration of at least 3 time sources though it is not mandated that the TOE is configured to always use at least 3 time sources.

## B.3.1.5 FCS SSHC EXT & FCS SSHS EXT SSH Protocol

SSH is not a required component of this cPP. If a TOE implements SSH, a corresponding selection in FTP\_ITC.1, FPT\_ITT.1 and/or FTP\_TRP.1/Admin should have been made that defines what the SSH protocol is implemented to protect.

A TOE may act as the client or the server in an SSH session. The requirement has been separated into SSH Client (FCS\_SSHC\_EXT) and SSH Server (FCS\_SSHS\_EXT) requirements to allow for these differences.

# FCS SSHC EXT.1

## **SSH Client Protocol**

**FCS\_SSHC\_EXT.1.1** The TSF shall implement the SSH protocol that complies with RFC(s) [selection: 4251, 4252, 4253, 4254, 5647, 5656, 6187, 6668, 8332].

## **Application Note 94**

The ST author selects which of the RFCs to which conformance is being claimed. Note that these need to be consistent with selections in later elements of this component (e.g.,

cryptographic algorithms permitted). RFC 4253 indicates that certain cryptographic algorithms are "REQUIRED". This means that the implementation must include support, not that the algorithms must be enabled for use. Ensuring that algorithms indicated as "REQUIRED" but not listed in the later elements of this component are implemented is out of scope of the evaluation activity for this requirement.

RFC 5647 only applies to the RFC compliant implementation of GCM; a TOE that only implements the "@openssh.com" variant of GCM should not select 5647. aes\*-gcm@openssh.com is specified in Section 1.6 of the OpenSSH Protocol Specification (https://cvsweb.openbsd.org/cgi-bin/cvsweb/src/usr.bin/ssh/PROTOCOL?rev=1.31).

**FCS\_SSHC\_EXT.1.2** The TSF shall ensure that the SSH protocol implementation supports the following authentication methods as described in RFC 4252: public key-based, [selection: password-based, no other method].

**FCS\_SSHC\_EXT.1.3** The TSF shall ensure that, as described in RFC 4253, packets greater than [assignment: *number of bytes*] bytes in an SSH transport connection are dropped.

## **Application Note 95**

RFC 4253 provides for the acceptance of "large packets" with the caveat that the packets should be of "reasonable length" or dropped. The assignment should be filled in by the ST author with the maximum packet size accepted, thus defining "reasonable length" for the TOE.

**FCS\_SSHC\_EXT.1.4** The TSF shall ensure that the SSH transport implementation uses the following encryption algorithms and rejects all other encryption algorithms: [selection: aes128-cbc, aes256-cbc, aes128-ctr, aes256-ctr, AEAD\_AES\_128\_GCM, AEAD\_AES\_256\_GCM, aes128-gcm@openssh.com, aes256-gcm@openssh.com].

# **Application Note 96**

RFC 5647 specifies the use of the AEAD\_AES\_128\_GCM and AEAD\_AES\_256\_GCM algorithms in SSH. As described in RFC 5647, AEAD\_AES\_128\_GCM and AEAD\_AES\_256\_GCM can only be chosen as encryption algorithms when the same algorithm is being used as the MAC algorithm. Corresponding FCS\_COP entries are included in the ST for the algorithms selected here.

FCS\_SSHC\_EXT.1.5 The TSF shall ensure that the SSH public-key based authentication implementation uses [selection: ssh-rsa, <u>rsa-sha2-256, rsa-sha2-512, ecdsa-sha2-nistp256, x509v3-ssh-rsa, ecdsa-sha2-nistp384, ecdsa-sha2-nistp521, x509v3-ecdsa-sha2-nistp256, x509v3-ecdsa-sha2-nistp384, x509v3-ecdsa-sha2-nistp521, x509v3-rsa2048-sha256] as its public key algorithm(s) and rejects all other public key algorithms.</u>

## Application Note 97

If x509v3-ssh-rsa, x509v3-ecdsa-sha2-nistp256, x509v3-ecdsa-sha2-nistp384, x509v3-ecdsa-sha2-nistp521 or x509v3-rsa2048-sha256 are selected, then the list of trusted certification authorities must be selected in FCS\_SSHC\_EXT.1.9 and the FIA\_X509\_EXT SFRs in Appendix B are applicable.

It is recommended to configure the TOE to reject presented RSA keys with a key length below 2048 bit. RFC 8332 specifies the use of rsa-sha2-256 or rsa-sha2-512 in SSH.

**FCS\_SSHC\_EXT.1.6** The TSF shall ensure that the SSH transport implementation uses [selection: hmac-shal, hmac-shal-96, hmac-sha2-256, hmac-sha2-512, AEAD\_AES\_128\_GCM, AEAD\_AES\_256\_GCM, implicit] as its data integrity MAC algorithm(s) and rejects all other MAC algorithm(s).

# Application Note 98

RFC 5647 specifies the use of the AEAD\_AES\_128\_GCM and AEAD\_AES\_256\_GCM algorithms in SSH. As described in RFC 5647, AEAD\_AES\_128\_GCM and AEAD\_AES\_256\_GCM can only be chosen as MAC algorithms when the same algorithm is being used as the encryption algorithm. RFC 6668 specifies the use of the sha2 algorithms in SSH.

The ST author selects "implicit" when, and only when, aes\*-gcm@openssh.com is selected as an encryption algorithm. When aes\*-gcm@openssh.com is negotiated as the encryption algorithm, the MAC algorithm field is ignored and GCM is implicitly used as the MAC. "implicit" is not an SSH algorithm identifier and will not be seen on the wire; however, the negotiated MAC might be decoded as "implicit".

FCS\_SSHC\_EXT.1.7 The TSF shall ensure that [selection: diffie-hellman-group14-sha1, diffie-hellman-group15-sha512, ecdh-sha2-nistp256] and [selection: diffie-hellman-group14-sha256, diffie-hellman-group16-sha512, ecdh-sha2-nistp384, ecdh-sha2-nistp521, no other methods] are the only allowed key exchange methods used for the SSH protocol.

**FCS\_SSHC\_EXT.1.8** The TSF shall ensure that within SSH connections the same session keys are used for a threshold of no longer than one hour, and no more than one gigabyte of transmitted data. After either of the thresholds are reached a rekey needs to be performed.

# **Application Note 99**

This SFR defines two thresholds - one for the maximum time span the same session keys can be used and the other one for the maximum amount of data that can be transmitted using the same session keys. Both thresholds need to be implemented and a rekey needs to be performed on whichever threshold is reached first. For the maximum transmitted data threshold, the total incoming and outgoing data needs to be counted. The rekey applies to all session keys (encryption, integrity protection) for incoming and outgoing traffic.

It is acceptable for a TOE to implement lower thresholds than the maximum values defined in the SFR.

For any configurable threshold related to this requirement the guidance documentation needs to specify how the threshold can be configured. The allowed values must either be specified in the guidance documentation and must be lower or equal to the thresholds specified in this SFR or the TOE must not accept values beyond the thresholds specified in this SFR.

**FCS\_SSHC\_EXT.1.9** The TSF shall ensure that the SSH client authenticates the identity of the SSH server using a local database associating each host name with its corresponding public key or [selection: *a list of trusted certification authorities, no other methods*] as described in RFC 4251 section 4.1.

The list of trusted certification authorities can only be selected if x509v3-ssh-rsa, x509v3-ecdsa-sha2-nistp256, x509v3-ecdsa-sha2-nistp384, x509v3-ecdsa-sha2-nistp521 or x509v3-rsa2048-sha256 are selected in FCS SSHC EXT.1.5.

# FCS SSHS EXT.1

### **SSH Server Protocol**

**FCS\_SSHS\_EXT.1.1** The TSF shall implement the SSH protocol that complies with RFC(s) [selection: 4251, 4252, 4253, 4254, 5647, 5656, 6187, 6668, 8332].

# Application Note 101

The ST author selects which of the RFCs to which conformance is being claimed. Note that these need to be consistent with selections in later elements of this component (e.g., cryptographic algorithms permitted). RFC 4253 indicates that certain cryptographic algorithms are "REQUIRED". This means that the implementation must include support, not that the algorithms must be enabled for use. Ensuring that algorithms indicated as "REQUIRED" but not listed in the later elements of this component are implemented is out of scope of the evaluation activity for this requirement.

RFC 5647 only applies to the RFC compliant implementation of GCM; a TOE that only implements the "@openssh.com" variant of GCM should not select 5647. aes\*-gcm@openssh.com is specified in Section 1.6 of the OpenSSH Protocol Specification (https://cvsweb.openbsd.org/cgi-bin/cvsweb/src/usr.bin/ssh/PROTOCOL?rev=1.31).

**FCS\_SSHS\_EXT.1.2** The TSF shall ensure that the SSH protocol implementation supports the following authentication methods as described in RFC 4252: public key-based, [selection:*password-based, no other method*].

# **Application Note 102**

If the TOE supports password-based authentication, the option 'password-based' shall be selected. If the TOE supports only public key-based authentication, the option 'no other method' shall be chosen.

**FCS\_SSHS\_EXT.1.3** The TSF shall ensure that, as described in RFC 4253, packets greater than [assignment: *number of bytes*] bytes in an SSH transport connection are dropped.

# **Application Note 103**

RFC 4253 provides for the acceptance of "large packets" with the caveat that the packets should be of "reasonable length" or dropped. The assignment should be filled in by the ST author with the maximum packet size accepted, thus defining "reasonable length" for the TOE.

FCS\_SSHS\_EXT.1.4 The TSF shall ensure that the SSH transport implementation uses the following encryption algorithms and rejects all other encryption algorithms: [selection: aes128-cbc, aes256-cbc, aes128-ctr, aes256-ctr, AEAD\_AES\_128\_GCM, AEAD\_AES\_256\_GCM, aes128-gcm@openssh.com, aes256-gcm@openssh.com].

RFC 5647 specifies the use of the AEAD\_AES\_128\_GCM and AEAD\_AES\_256\_GCM algorithms in SSH. As described in RFC 5647, AEAD\_AES\_128\_GCM and AEAD\_AES\_256\_GCM can only be chosen as encryption algorithms when the same algorithm is being used as the MAC algorithm. Corresponding FCS\_COP entries are included in the ST for the algorithms selected here.

FCS\_SSHS\_EXT.1.5 The TSF shall ensure that the SSH public-key based authentication implementation uses [selection: *ssh-rsa*, *rsa-sha2-256*, *rsa-sha2-512*, *ecdsa-sha2-nistp256*, *x509v3-ssh-rsa*, *ecdsa-sha2-nistp384*, *ecdsa-sha2-nistp521*, *x509v3-ecdsa-sha2-nistp256*, *x509v3-ecdsa-sha2-nistp384*, *x509v3-ecdsa-sha2-nistp521*, *x509v3-rsa2048-sha256*] as its public key algorithm(s) and rejects all other public key algorithms.

# **Application Note 105**

If x509v3-ssh-rsa, x509v3-ecdsa-sha2-nistp256, x509v3-ecdsa-sha2-nistp384, x509v3-ecdsa-sha2-nistp521 or x509v3-rsa2048-sha256 are selected, then the FIA\_X509\_EXT SFRs in Appendix B are applicable.

It is recommended to configure the TOE to reject presented RSA keys with a key length below 2048 bit. RFC 8332 specifies the use of rsa-sha2-256 or rsa-sha2-512 in SSH

**FCS\_SSHS\_EXT.1.6** The TSF shall ensure that the SSH transport implementation uses [selection: hmac-sha1, hmac-sha1-96, hmac-sha2-256, hmac-sha2-512, AEAD\_AES\_128\_GCM, AEAD\_AES\_256\_GCM, implicit] as its MAC algorithm(s) and rejects all other MAC algorithm(s).

# Application Note 106

RFC 5647 specifies the use of the AEAD\_AES\_128\_GCM and AEAD\_AES\_256\_GCM algorithms in SSH. As described in RFC 5647, AEAD\_AES\_128\_GCM and AEAD\_AES\_256\_GCM can only be chosen as MAC algorithms when the same algorithm is being used as the encryption algorithm. RFC 6668 specifies the use of the sha2 algorithms in SSH.

The ST author selects "implicit" when, and only when, aes\*-gcm@openssh.com is selected as an encryption algorithm. When aes\*-gcm@openssh.com is negotiated as the encryption algorithm, the MAC algorithm field is ignored and GCM is implicitly used as the MAC. "implicit" is not an SSH algorithm identifier and will not be seen on the wire; however, the negotiated MAC might be decoded as "implicit".

FCS\_SSHS\_EXT.1.7 The TSF shall ensure that [selection: diffie-hellman-group14-sha1, diffie-hellman-group15-sha512, ecdh-sha2-nistp256] and [selection: diffie-hellman-group14-sha256, diffie-hellman-group16-sha512, ecdh-sha2-nistp384, ecdh-sha2-nistp521, no other methods] are the only allowed key exchange methods used for the SSH protocol.

FCS\_SSHS\_EXT.1.8 The TSF shall ensure that within SSH connections the same session keys are used for a threshold of no longer than one hour, and no more than one gigabyte of transmitted data. After either of the thresholds are reached a rekey needs to be performed.

This SFR defines two thresholds - one for the maximum time span the same session keys can be used and the other one for the maximum amount of data that can be transmitted using the same session keys. Both thresholds need to be implemented and a rekey needs to be performed on whichever threshold is reached first. For the maximum transmitted data threshold, the total incoming and outgoing data needs to be counted. The rekey applies to all session keys (encryption, integrity protection) for incoming and outgoing traffic.

It is acceptable for a TOE to implement lower thresholds than the maximum values defined in the SFR.

For any configurable threshold related to this requirement the guidance documentation needs to specify how the threshold can be configured. The allowed values must either be specified in the guidance documentation and must be lower or equal to the thresholds specified in this SFR or the TOE must not accept values beyond the thresholds specified in this SFR.

# **B.3.1.6 FCS TLSC EXT & FCS TLSS EXT TLS Protocol**

TLS is not a required component of this cPP. If a TOE implements TLS, a corresponding selection in FPT\_ITT.1, FTP\_ITC.1, or FTP\_TRP.1/Admin should be made to define what the TLS protocol is implemented to protect.

A TOE may act as the client, the server, or both in TLS sessions. The requirement has been separated into TLS Client (FCS\_TLSC\_EXT) and TLS Server (FCS\_TLSS\_EXT) requirements to allow for these differences. If the TOE acts as the client during the claimed TLS sessions, the ST author should claim one of the FCS\_TLSC\_EXT requirements. If the TOE acts as the server during the claimed TLS sessions, the ST author should claim one of the FCS\_TLSS\_EXT requirements. If the TOE acts as both a client and server during the claimed TLS sessions, the ST author should claim one of the FCS\_TLSC\_EXT and FCS\_TLSS\_EXT requirements.

Additionally, TLS may or may not be performed with client authentication. The ST author shall claim FCS\_TLSC\_EXT.1 and/or FCS\_TLSS\_EXT.1 if the TOE does not support client authentication. The ST author should claim FCS\_TLSC\_EXT.2 and/or FCS\_TLSS\_EXT.2 if client authentication is performed by the TOE.

# FCS TLSC EXT.1

# **TLS Client Protocol**

**FCS\_TLSC\_EXT.1.1** The TSF shall implement [selection: *TLS 1.2 (RFC 5246), TLS 1.1 (RFC 4346)*] and reject all other TLS and SSL versions. The TLS implementation will support the following ciphersuites:

# [selection:

- TLS\_RSA\_WITH\_AES\_128 CBC SHA as defined in RFC 3268
- TLS RSA WITH AES 256 CBC SHA as defined in RFC 3268
- TLS DHE RSA WITH AES 128 CBC SHA as defined in RFC 3268

- TLS DHE RSA WITH AES 256 CBC SHA as defined in RFC 3268
- TLS ECDHE RSA WITH AES 128 CBC SHA as defined in RFC 4492
- TLS ECDHE RSA WITH AES 256 CBC SHA as defined in RFC 4492
- TLS ECDHE ECDSA WITH AES 128 CBC SHA as defined in RFC 4492
- TLS ECDHE ECDSA WITH AES 256 CBC SHA as defined in RFC 4492
- TLS RSA WITH AES 128 CBC SHA256 as defined in RFC 5246
- TLS RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
- TLS\_DHE\_RSA\_WITH\_AES\_128\_CBC\_SHA256 as defined in RFC 5246
- TLS DHE RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
- TLS RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
- TLS RSA WITH AES 256 GCM SHA384 as defined in RFC 5288
- TLS DHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
- TLS DHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5288
- TLS ECDHE ECDSA WITH AES 128 CBC SHA256 as defined in RFC 5289
- TLS ECDHE ECDSA WITH AES 256 CBC SHA384 as defined in RFC 5289
- TLS ECDHE ECDSA WITH AES 128 GCM SHA256 as defined in RFC 5289
- TLS ECDHE ECDSA WITH AES 256 GCM SHA384 as defined in RFC 5289
- TLS ECDHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5289
- TLS ECDHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5289
- TLS ECDHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5289
- TLS\_ECDHE\_RSA\_WITH\_AES\_256\_CBC\_SHA384 as defined in RFC 5289 ].

The ciphersuites to be tested in the evaluated configuration are limited by this requirement. The ST author should select the ciphersuites that are supported. Even though RFC 5246 mandates implementation of specific ciphers, there is no requirement to implement TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA in order to claim conformance to this cPP.

These requirements will be revisited as new TLS versions are standardized by the IETF.

*In a future version of this cPP TLS v1.2 will be required for all TOEs.* 

**FCS\_TLSC\_EXT.1.2** The TSF shall verify that the presented identifier matches the reference identifier per RFC 6125 section 6.

# **Application Note 109**

The rules for verification of identity are described in Section 6 of RFC 6125. The reference identifier is established by the Administrator (e.g. entering a URL into a web browser or clicking a link), by configuration (e.g. configuring the name of a mail server or authentication server), or by an application (e.g. a parameter of an API) depending on the application service. Based on a singular reference identifier's source domain and application service type (e.g. HTTP, SIP, LDAP), the client establishes all reference identifiers which are acceptable, such as a Common Name for the Subject Name field of the certificate and a (case-insensitive) DNS name, URI name, and Service Name for the Subject Alternative Name field. The client then

compares this list of all acceptable reference identifiers to the presented identifiers in the TLS server's certificate.

The preferred method for verification is the Subject Alternative Name using DNS names, URI names, or Service Names. Verification using the Common Name is required for the purposes of backwards compatibility. Additionally, support for use of IP addresses in the Subject Name or Subject Alternative name is discouraged as against best practices but may be implemented. Finally, the client should avoid constructing reference identifiers using wildcards. However, if the presented identifiers include wildcards, the client must follow the best practices regarding matching; these best practices are captured in the evaluation activity.

FCS\_TLSC\_EXT.1.3 When establishing a trusted channel, by default the TSF shall not establish a trusted channel if the server certificate is invalid. The TSF shall also [selection:

- Not implement any administrator override mechanism
- require administrator authorization to establish the connection if the TSF fails to [selection: match the reference identifier, validate certificate path, validate expiration date, determine the revocation status] of the presented server certificate

].

# Application Note 110

"Revocation status" refers to a OCSP or CRL response that indicates the presented certificate is invalid. Inability to make a connection to determine validity shall be handled as specified in FIA X509 EXT.2.2.

If TLS is selected in FTP\_ITC then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/Rev.

If TLS is selected in FPT\_ITT, then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/ITT.

**FCS\_TLSC\_EXT.1.4** The TSF shall [selection: not present the Supported Elliptic Curves Extension, present the Supported Elliptic Curves Extension with the following NIST curves: [selection: secp256r1, secp384r1, secp521r1] and no other curves] in the Client Hello.

# Application Note 111

If ciphersuites with elliptic curves were selected in FCS\_TLSC\_EXT.1.1, a selection of one or more curves is required. If no ciphersuites with elliptic curves were selected in FCS\_TLSC\_EXT.1.1, then "not present the Support Elliptic Curves Extension" should be selected.

This requirement limits the elliptic curves allowed for authentication and key agreement to the NIST curves from FCS\_COP.1/SigGen and FCS\_CKM.1 and FCS\_CKM.2. This extension is required for clients supporting Elliptic Curve ciphersuites.

# FCS TLSC EXT.2

# **TLS Client Protocol with authentication**

**FCS\_TLSC\_EXT.2.1** The TSF shall implement [selection: *TLS 1.2 (RFC 5246), TLS 1.1 (RFC 4346)*] and reject all other TLS and SSL versions. The TLS implementation will support the following ciphersuites:

# [selection:

- TLS RSA WITH AES 128 CBC SHA as defined in RFC 3268
- TLS RSA WITH AES 256 CBC SHA as defined in RFC 3268
- TLS DHE RSA WITH AES 128 CBC SHA as defined in RFC 3268
- TLS DHE RSA WITH AES 256 CBC SHA as defined in RFC 3268
- TLS ECDHE RSA WITH AES 128 CBC SHA as defined in RFC 4492
- TLS ECDHE RSA WITH AES 256 CBC SHA as defined in RFC 4492
- TLS ECDHE ECDSA WITH AES 128 CBC SHA as defined in RFC 4492
- TLS ECDHE ECDSA WITH AES 256 CBC SHA as defined in RFC 4492
- TLS RSA WITH AES 128 CBC SHA256 as defined in RFC 5246
- TLS RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
- TLS DHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5246
- TLS DHE RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
- TLS RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
- TLS RSA WITH AES 256 GCM SHA384 as defined in RFC 5288
- TLS DHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
- TLS DHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5288
- TLS ECDHE ECDSA WITH AES 128 CBC SHA256 as defined in RFC 5289
- TLS ECDHE ECDSA WITH AES 256 CBC SHA384 as defined in RFC 5289
- TLS ECDHE ECDSA WITH AES 128 GCM SHA256 as defined in RFC 5289
- TLS ECDHE ECDSA WITH AES 256 GCM SHA384 as defined in RFC 5289
- TLS ECDHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5289
- TLS ECDHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5289
- TLS ECDHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5289
- TLS\_ECDHE\_RSA\_WITH\_AES\_256\_CBC\_SHA384 as defined in RFC 5289 ].

# **Application Note 112**

The ciphersuites to be tested in the evaluated configuration are limited by this requirement. The ST author should select the ciphersuites that are supported. Even though RFC 5246 mandates implementation of specific ciphers, there is no requirement to implement TLS RSA WITH AES 128 CBC SHA in order to claim conformance to this cPP.

These requirements will be revisited as new TLS versions are standardized by the IETF.

*In a future version of this cPP TLS v1.2 will be required for all TOEs.* 

FCS\_TLSC\_EXT.2.2 The TSF shall verify that the presented identifier matches the reference identifier per RFC 6125 section 6.

# **Application Note 113**

The rules for verification of identify are described in Section 6 of RFC 6125. The reference identifier is established by the Administrator (e.g. entering a URL into a web browser or clicking a link), by configuration (e.g. configuring the name of a mail server or authentication server), or by an application (e.g. a parameter of an API) depending on the application service. Based on a singular reference identifier's source domain and application service type (e.g. HTTP, SIP, LDAP), the client establishes all reference identifiers which are acceptable, such as a Common Name for the Subject Name field of the certificate and a (case-insensitive) DNS name, URI name, and Service Name for the Subject Alternative Name field. The client then compares this list of all acceptable reference identifiers to the presented identifiers in the TLS server's certificate.

The preferred method for verification is the Subject Alternative Name using DNS names, URI names, or Service Names. Verification using the Common Name is required for the purposes of backwards compatibility. Additionally, support for use of IP addresses in the Subject Name or Subject Alternative name is discouraged as against best practices but may be implemented. Finally, the client should avoid constructing reference identifiers using wildcards. However, if the presented identifiers include wildcards, the client must follow the best practices regarding matching; these best practices are captured in the evaluation activity.

FCS\_TLSC\_EXT.2.3 When establishing a trusted channel, by default the TSF shall not establish a trusted channel if the server certificate is invalid. The TSF shall also [selection:

- Not implement any administrator override mechanism
- require administrator authorization to establish the connection if the TSF fails to [selection: match the reference identifier, validate certificate path, validate expiration date, determine the revocation status] of the presented server certificate

].

# Application Note 114

"Revocation status" refers to a OCSP or CRL response that indicates the presented certificate is invalid. Inability to make a connection to determine validity shall be handled as specified in FIA X509 EXT.2.2.

If TLS is selected in FTP\_ITC then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/Rev.

If TLS is selected in FPT\_ITT, then certificate validity is tested in accordance with testing performed for FIA\_X509\_EXT.1/ITT.

**FCS\_TLSC\_EXT.2.4** The TSF shall [selection: not present the Supported Elliptic Curves Extension, present the Supported Elliptic Curves Extension with the following NIST curves: [selection: secp256r1, secp384r1, secp521r1] and no other curves] in the Client Hello.

If ciphersuites with elliptic curves were selected in FCS\_TLSC\_EXT.2.1, a selection of one or more curves is required. If no ciphersuites with elliptic curves were selected in FCS\_TLSC\_EXT.2.1, then "not present the Supported Elliptic Curves Extension" should be selected.

This requirement limits the elliptic curves allowed for authentication and key agreement to the NIST curves from FCS\_COP.1/SigGen and FCS\_CKM.1 and FCS\_CKM.2. This extension is required for clients supporting Elliptic Curve ciphersuites.

FCS\_TLSC\_EXT.2.5 The TSF shall support mutual authentication using X.509v3 certificates.

# Application Note 116

The use of X.509v3 certificates for TLS is addressed in FIA\_X509\_EXT.2.1. This requirement adds that the client must be capable of presenting a certificate to a TLS server for TLS mutual authentication.

# FCS TLSS EXT.1

# **TLS Server Protocol**

**FCS\_TLSS\_EXT.1.1** The TSF shall implement [selection: *TLS 1.2 (RFC 5246), TLS 1.1 (RFC 4346)*] and reject all other TLS and SSL versions. The TLS implementation will support the following ciphersuites:

# [selection:

- TLS RSA WITH AES 128 CBC SHA as defined in RFC 3268
- TLS RSA WITH AES 256 CBC SHA as defined in RFC 3268
- TLS DHE RSA WITH AES 128 CBC SHA as defined in RFC 3268
- TLS DHE RSA WITH AES 256 CBC SHA as defined in RFC 3268
- TLS ECDHE RSA WITH AES 128 CBC SHA as defined in RFC 4492
- TLS ECDHE RSA WITH AES 256 CBC SHA as defined in RFC 4492
- TLS ECDHE ECDSA WITH AES 128 CBC SHA as defined in RFC 4492
- TLS ECDHE ECDSA WITH AES 256 CBC SHA as defined in RFC 4492
- TLS RSA WITH AES 128 CBC SHA256 as defined in RFC 5246
- TLS RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
- TLS DHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5246
- TLS DHE RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
- TLS RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
- TLS\_RSA\_WITH\_AES\_256\_GCM\_SHA384 as defined in RFC 5288
- TLS DHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
- TLS DHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5288
- TLS ECDHE ECDSA WITH AES 128 CBC SHA256 as defined in RFC 5289

- TLS ECDHE ECDSA WITH AES 256 GCM SHA384 as defined in RFC 5289
- TLS ECDHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5289
- TLS ECDHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5289
- TLS ECDHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5289
- TLS\_ECDHE\_RSA\_WITH\_AES\_256\_CBC\_SHA384 as defined in RFC 5289 ].

The ciphersuites to be tested in the evaluated configuration are limited by this requirement. The ST author should select the optional ciphersuites that are supported. Even though RFC 5246 mandates implementation of specific ciphers, there is no requirement to implement TLS RSA WITH AES 128 CBC SHA in order to claim conformance to this cPP.

These requirements will be revisited as new TLS versions are standardized by the IETF.

In a future version of this cPP TLS v1.2 will be required for all TOEs.

**FCS\_TLSS\_EXT.1.2** The TSF shall deny connections from clients requesting SSL 2.0, SSL 3.0, TLS 1.0 and [selection: *TLS 1.1, TLS 1.2, none*].

# Application Note 118

All SSL versions and TLS v1.0 are denied. Any TLS versions not selected in FCS\_TLSS\_EXT.1.1 should be selected here. (If "none" is the selection for this element then the ST author may omit the words "and none".)

**FCS\_TLSS\_EXT.1.3** The TSF shall [selection: perform RSA key establishment with key size [selection: 2048 bits, 3072 bits, 4096 bits]; generate EC Diffie-Hellman parameters over NIST curves [selection: secp256r1, secp384r1, secp521r1] and no other curves; generate Diffie-Hellman parameters of size [selection: 2048 bits, 3072 bits]].

# Application Note 119

If the ST lists a DHE or ECDHE ciphersuite in FCS\_TLSS\_EXT.1.1, the ST must include the Diffie-Hellman or NIST curves selection in the requirement. FMT\_SMF.1 requires the configuration of the key agreement parameters to establish the security strength of the TLS connection.

# FCS TLSS EXT.2

# TLS Server Protocol with mutual authentication

FCS\_TLSS\_EXT.2.1 The TSF shall implement [selection: *TLS 1.2 (RFC 5246), TLS 1.1 (RFC 4346)*] and reject all other TLS and SSL versions. The TLS implementation will support the following ciphersuites:

### *Iselection:*

- TLS RSA WITH AES 128 CBC SHA as defined in RFC 3268
- TLS RSA WITH AES 256 CBC SHA as defined in RFC 3268
- TLS DHE RSA WITH AES 128 CBC SHA as defined in RFC 3268
- TLS DHE RSA WITH AES 256 CBC SHA as defined in RFC 3268
- TLS ECDHE RSA WITH AES 128 CBC SHA as defined in RFC 4492

- TLS ECDHE RSA WITH AES 256 CBC SHA as defined in RFC 4492
- TLS ECDHE ECDSA WITH AES 128 CBC SHA as defined in RFC 4492
- TLS ECDHE ECDSA WITH AES 256 CBC SHA as defined in RFC 4492
- TLS RSA WITH AES 128 CBC SHA256 as defined in RFC 5246
- TLS RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
- TLS DHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5246
- TLS DHE RSA WITH AES 256 CBC SHA256 as defined in RFC 5246
- TLS RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
- TLS RSA WITH AES 256 GCM SHA384 as defined in RFC 5288
- TLS DHE RSA WITH AES 128 GCM SHA256 as defined in RFC 5288
- TLS\_DHE\_RSA\_WITH\_AES\_256\_GCM\_SHA384 as defined in RFC 5288
- TLS ECDHE ECDSA WITH AES 128 CBC SHA256 as defined in RFC 5289
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_256\_CBC\_SHA384 as defined in RFC 5289
- TLS ECDHE ECDSA WITH AES 128 GCM SHA256 as defined in RFC 5289
- TLS ECDHE ECDSA WITH AES 256 GCM SHA384 as defined in RFC 5289
- TLS\_ECDHE\_RSA\_WITH\_AES\_128\_GCM\_SHA256 as defined in RFC 5289
- TLS ECDHE RSA WITH AES 256 GCM SHA384 as defined in RFC 5289
- TLS ECDHE RSA WITH AES 128 CBC SHA256 as defined in RFC 5289
- TLS\_ECDHE\_RSA\_WITH\_AES\_256\_CBC\_SHA384 as defined in RFC 5289 ].

The ciphersuites to be tested in the evaluated configuration are limited by this requirement. The ST author should select the optional ciphersuites that are supported. Even though RFC 5246 mandates implementation of specific ciphers, there is no requirement to implement TLS RSA WITH AES 128 CBC SHA in order to claim conformance to this cPP.

These requirements will be revisited as new TLS versions are standardized by the IETF.

*In a future version of this cPP TLS v1.2 will be required for all TOEs.* 

**FCS\_TLSS\_EXT.2.2** The TSF shall deny connections from clients requesting SSL 2.0, SSL 3.0, TLS 1.0 and [selection: *TLS 1.1, TLS 1.2, none*].

# Application Note 121

All SSL versions and TLS v1.0 are denied. Any TLS versions not selected in FCS\_TLSS\_EXT.1.1 should be selected here. (If "none" is the selection for this element then the ST author may omit the words "and none".)

**FCS\_TLSS\_EXT.2.3** The TSF shall [selection: perform RSA key establishment with key size [selection: 2048 bits, 3072 bits, 4096 bits]; generate EC Diffie-Hellman parameters over NIST curves [selection: secp256r1, secp384r1, secp521r1] and no other curves; generate Diffie-Hellman parameters of size [selection: 2048 bits, 3072 bits]].

# **Application Note 122**

If the ST lists a DHE or ECDHE ciphersuite in FCS\_TLSS\_EXT.2.1, the ST must include the Diffie-Hellman or NIST curves selection in the requirement. FMT\_SMF.1 requires the configuration of the key agreement parameters to establish the security strength of the TLS connection.

FCS\_TLSS\_EXT.2.4 The TSF shall support mutual authentication of TLS clients using X.509v3 certificates.

# **Application Note 123**

The use of X.509v3 certificates for TLS is addressed in FIA\_X509\_EXT.2.1. This requirement adds that this use must include support for client-side certificates for TLS mutual authentication

FCS\_TLSS\_EXT.2.5 When establishing a trusted channel, by default the TSF shall not establish a trusted channel if the client certificate is invalid. The TSF shall also [selection:

- Not implement any administrator override mechanism
- require administrator authorization to establish the connection if the TSF fails to [selection: match the reference identifier, validate certificate path, validate expiration date, determine the revocation status] of the presented client certificate

].

# Application Note 124

"Revocation status" refers to a OCSP or CRL response that indicates the presented certificate is invalid. Inability to make a connection to determine validity shall be handled as specified in FIA X509 EXT.2.2.

If TLS is selected in FTP\_ITC then certificate validity is tested in accordance with testing performed for FIA\_X509\_EXT.1/Rev.

If TLS is selected in FPT\_ITT, then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/ITT.

FCS\_TLSS\_EXT.2.6 The TSF shall not establish a trusted channel if the distinguished name (DN) or Subject Alternative Name (SAN) contained in a certificate does not match the expected identifier for the client.

# **Application Note 125**

The client identifier may be in the Subject field or the Subject Alternative Name extension of the certificate. The expected identifier may either be configured, may be compared to the Domain Name, IP address, username, or email address used by the client, or may be passed to a directory server for comparison.

# **B.4** Identification and Authentication (FIA)

# **B.4.1** Authentication using X.509 certificates (Extended – FIA X509 EXT)

X.509 certificate-based authentication is required if IPsec or TLS communications are claimed for FPT\_ITT, FTP\_ITC.1 or FTP\_TRP. These SFRs are also required if FPT\_TUD\_EXT.2 or FPT\_TST\_EXT.2 are claimed. If SSH client communications are claimed and any x509 algorithms are claimed in FCS\_SSHC\_EXT.1.5 or FCS\_SSHS\_EXT.1.5, these SFRs are required. In the case of the TOE only acting as the SSH server or acting as the client, but not

claiming any x509 algorithms in FCS\_SSHC\_EXT.1.5 or FCS\_SSHS\_EXT.1.5, these SFRs are optional.

Although the functionality in FIA\_X509\_EXT.1 and FIA\_X509\_EXT.2 is always required when using X.509 certificate-based authentication, the TOE only needs to be able to generate a Certification Request if the TOE needs to present an X.509 certificate to another endpoint via the TSF for authentication (i.e. if at least one of the following SFRs is included in the ST: FCS\_DTLSC\_EXT.2, FCS\_DTLSS\_EXT.1, FCS\_DTLSS\_EXT.2, FCS\_IPSEC\_EXT.1, FCS\_SHC\_EXT.1.5 (applicable only if at least one of the x509v3-\* ciphers is selected), FCS\_SSHS\_EXT.1.5 (applicable only if at least one of the x509v3-\* ciphers is selected), FCS\_TLSC\_EXT.2, FCS\_TLSS\_EXT.1, FCS\_TLSS\_EXT.2).. Therefore FIA\_X509\_EXT.3 only needs to be added to the ST in this case. If the TOE does not need to present an X.509 certificate to another endpoint via the TSF for authentication (e.g. a client not supporting mutual authentication) the use of FIA\_X509\_EXT.3 is optional.

# B.4.1.1 FIA\_X509\_EXT.1 X.509 Certificate Validation

# FIA X509 EXT.1/Rev X.509 Certificate Validation

**FIA\_X509\_EXT.1.1/Rev** The TSF shall validate certificates in accordance with the following rules:

- RFC 5280 certificate validation and certification path validation supporting a minimum path length of three certificates.
- The certification path must terminate with a trusted CA certificate designated as a trust anchor.
- The TSF shall validate a certification path by ensuring that all CA certificates in the certification path contain the basicConstraints extension with the CA flag set to TRUE.
- The TSF shall validate the revocation status of the certificate using [selection: the Online Certificate Status Protocol (OCSP) as specified in RFC 6960, a Certificate Revocation List (CRL) as specified in RFC 5280 Section 6.3, Certificate Revocation List (CRL) as specified in RFC 5759 Section 5]
- The TSF shall validate the extendedKeyUsage field according to the following rules:
  - Certificates used for trusted updates and executable code integrity verification shall have the Code Signing purpose (id-kp 3 with OID 1.3.6.1.5.5.7.3.3) in the extendedKeyUsage field.
  - Server certificates presented for TLS shall have the Server Authentication purpose (id-kp 1 with OID 1.3.6.1.5.5.7.3.1) in the extendedKeyUsage field.
  - Client certificates presented for TLS shall have the Client Authentication purpose (id-kp 2 with OID 1.3.6.1.5.5.7.3.2) in the extendedKeyUsage field.
  - OCSP certificates presented for OCSP responses shall have the OCSP Signing purpose (id-kp 9 with OID 1.3.6.1.5.5.7.3.9) in the extendedKeyUsage field.

**FIA\_X509\_EXT.1.2/Rev** The TSF shall only treat a certificate as a CA certificate if the basicConstraints extension is present and the CA flag is set to TRUE.

# **Application Note 126**

FIA X509 EXT.1.1/Rev lists the rules for validating certificates. The ST author selects whether revocation status is verified using OCSP or CRLs. The trusted channel/path protocols may require that certificates are used; this use may require that specific certificate extensions must be present and checked. If the TOE supports functionality that does not use any of the possible values listed in the specific certificate extension, then it is reasonable to process such certificate as the relevant part of the SFR is considered trivially satisfied. However, this does not mean that it is allowable to accept certificates with inappropriate extension values simply because a specific security function is not implemented by the TOE. For example, the TOE should not successfully authenticate a web server that presents an X.509v3 certificate that has extendedKeyUsage set to only OCSPSigning, even if the TOE does not implement OCSP revocation checking. The TOE shall be capable of supporting a minimum path length of three certificates. That is, the TOE shall support a hierarchy comprising of at least a self-signed root CA certificate, a subordinate CA certificate, and a leaf certificate. The chain validation is expected to terminate with a trust anchor. This means the validation can terminate with any trusted CA certificate designated as a trust anchor. This CA certificate must be loaded into the trust store ('certificate store', ' trusted CA Key Store' or similar) managed by the TOE trust store. If the TOE's trust store supports loading of multiple hierarchical CA certificates or certificate chains, the TOE must clearly indicate all certificates that it considers trust anchors.

*The validation of X.509v3 leaf certificates comprises several steps:* 

- a) A Certificate Revocation Check refers to the process of determining the current revocation status of an otherwise structurally valid certificate. This must be performed every time a certificate is used for authentication. This check must be performed for each certificate in the chain up to, but not including, the trust anchor. This means that CA certificates that are not trust anchors, and leaf certificates in the chain, must be checked. It is not required to check the revocation status of any CA certificate designated a trust anchor, however if such check is performed it must be handled consistently with how other certificates are checked.
- b) An expiration check must be performed. This check must be conducted for each certificate in the chain, up to and including the trust anchor.
- c) The continuity of the chain must be checked, showing that the signature on each certificate that is presented to the TOE is valid and the chain terminates at the trust anchor.
- d) The presence of relevant extensions in each certificate in the chain such as the extendedKeyUsage parameters of the leaf certificate must correspond to SFR-relevant functionality. For example, a peer acting as a web server should have TLS Web Server Authentication listed as an extendedKeyUsage parameter of its X.509v3 certificate. It shall be checked that the relevant extensions in each certificate in the chain such as the extendedKeyUsage parameters of the leaf certificate correspond to the SFR-relevant functionality they are used with.

The notable exception to performing a Certificate Revocation Check is if an X.509v3 certificate is used as part of FPT\_TST\_EXT.2 Self-tests based on certificates. Since such checks are typically performed early during boot cycle, it might not be feasible to perform a revocation check. In such cases, the requirement to perform a revocation check as part of self-testing is waived.

It is expected that revocation checking is performed when a certificate is used in an authentication step. It is expected that revocation checking is performed on both leaf and intermediate CA certificates when a leaf certificate is presented to the TOE as part of the certificate chain during authentication. Revocation checking of any CA certificate designated a trust anchor is not required.

If the TOE implements mutual authentication or acts as a server, there is no expectation of performing any checks on TOE's own leaf certificate during authentication.

FIA\_X509\_EXT.1.2/Rev applies to certificates that are used and processed by the TSF and restricts the certificates that may be added as trusted CA certificates.

The ST author must include FIA\_X509\_EXT.1/Rev in all instances except when only SSH is selected within FTP\_ITC.1 or FPT\_ITT.1, and implementation is limited to public-key authentication that does not rely on X.509 certificates. Additionally, FIA\_X509\_EXT.1/Rev must also be included if either FPT\_TUD\_EXT or FPT\_TST\_EXT have selected to use X.509v3 certificates.

# **B.4.1.2** FIA\_X509\_EXT.2 X.509 Certificate Authentication

# FIA X509 EXT.2 X.509 Certificate Authentication

**FIA\_X509\_EXT.2.1** The TSF shall use X.509v3 certificates as defined by RFC 5280 to support authentication for [selection: *DTLS, HTTPS, IPsec, SSH, TLS*], and [selection: *code signing for system software updates, code signing for integrity verification, [assignment: other uses], no additional uses*].

**FIA\_X509\_EXT.2.2** When the TSF cannot establish a connection to determine the validity of a certificate, the TSF shall [selection: *allow the Administrator to choose whether to accept the certificate in these cases, accept the certificate, not accept the certificate*].

# Application Note 127

In FIA\_X509\_EXT.2.1, the ST author's selection includes IPsec, TLS, or HTTPS if these protocols are included in FTP\_ITC.1.1 or FPT\_ITT.1. SSH should be included if authentication other than ssh-rsa, ecdsa-sha2-nistp256, ecdsa-sha2-nistp384, and/or ecdsa-sha2-nistp521 is selected in FCS\_SSHC\_EXT.1.5 or FCS\_SSHS\_EXT.1.5. Certificates may optionally be used for trusted updates of system software (FPT\_TUD\_EXT.2) and for integrity verification (FPT\_TST\_EXT.2).

Often a connection must be established to check the revocation status of a certificate - either to download a CRL or to perform a lookup using OCSP. In FIA\_X509\_EXT.2.2 the selection is used to describe the behaviour in the event that such a connection cannot be established (for example, due to a network error). If the TOE has determined the certificate is valid according to all other rules in FIA\_X509\_EXT.1, the behaviour indicated in the selection determines the validity. The TOE must not accept the certificate if it fails any of the other validation rules in

FIA\_X509\_EXT.1. If the Administrator-configured option is selected by the ST Author, the ST Author also selects the corresponding function in FMT\_SMF.1. The selection should be consistent with the validation requirements in FCS\_IPSEC\_EXT.1.14, FCS\_TLSC\_EXT.1.3 and FCS\_TLSC\_EXT.2.3.

If the TOE is distributed and FIA\_X509\_EXT.1/ITT is selected, then certificate revocation checking is optional. This is due to additional authorization actions being performed in the enabling and disabling of the intra-TOE trusted channel as defined in FCO\_CPC\_EXT.1. In this case, a connection is not required to determine certificate validity and this SFR is trivially satisfied.

The ST author must include FIA\_X509\_EXT.2 in all instances except when only SSH is selected within FTP\_ITC.1 or FPT\_ITT.1 and ssh-rsa, ecdsa-sha2-nistp256, ecdsa-sha2-nistp384, and/or ecdsa-sha2-nistp521 authentication is also selected. Additionally, FIA\_X509\_EXT.2 must also be included if either FPT\_TUD\_EXT or FPT\_TST\_EXT have selected X509 certificates.

# **B.4.1.3 FIA X509 EXT.3 X.509 Certificate Requests**

Although the functionality in FIA\_X509\_EXT.1 and FIA\_X509\_EXT.2 is always required when using X.509 certificate-based authentication, the TOE only needs to be able to generate a Certification Request if the TOE needs to present an X.509 certificate to another endpoint via the TSF for authentication (i.e. if at least one of the following SFRs is included in the ST: FCS\_DTLSC\_EXT.2, FCS\_DTLSS\_EXT.1, FCS\_DTLSS\_EXT.2, FCS\_IPSEC\_EXT.1, FCS\_SHC\_EXT.1.5 (applicable only if at least one of the x509v3-\* ciphers is selected), FCS\_SSHS\_EXT.1.5 (applicable only if at least one of the x509v3-\* ciphers is selected), FCS\_TLSC\_EXT.2, FCS\_TLSS\_EXT.1, FCS\_TLSS\_EXT.2).. Therefore FIA\_X509\_EXT.3 only needs to be added to the ST in this case. If the TOE does not need to present an X.509 certificate to another endpoint via the TSF for authentication (e.g. a client not supporting mutual authentication) the use of FIA\_X509\_EXT.3 is optional.

# FIA X509 EXT.3 X.509 Certificate Requests

**FIA\_X509\_EXT.3.1** The TSF shall generate a Certificate Request as specified by RFC 2986 and be able to provide the following information in the request: public key and [selection: device-specific information, Common Name, Organization, Organizational Unit, Country].

# Application Note 128

The public key is the public key portion of the public-private key pair generated by the TOE as specified in FCS CKM.1.

**FIA\_X509\_EXT.3.2** The TSF shall validate the chain of certificates from the Root CA upon receiving the CA Certificate Response.

# **B.5** Protection of the TSF (FPT)

# **B.5.1** TSF self-test (Extended)

# **B.5.1.1FPT TST EXT.2** Self-tests based on certificates

# FPT TST EXT.2

# **Self-tests based on certificates**

**FPT\_TST\_EXT.2.1** The TSF shall fail self-testing if a certificate is used for self-tests and the corresponding certificate is deemed invalid.

# **Application Note 129**

Certificates may optionally be used for self-tests (FPT\_TST\_EXT.1.1). This element must be included in the ST if certificates are used for self-tests. If "code signing for integrity verification" is selected in FIA X509 EXT.2.1, FPT TST EXT.2 must be included in the ST.

Validity is determined by the certification path and the expiration date. If the self-test is executed as part of TOE initialization (e.g. boot), there is no expectation of a revocation status check as the necessary functionality, configuration, or infrastructure required to perform such check might not be available.

# **B.5.2** Trusted Update (FPT\_TUD\_EXT)

# **B.5.2.1FPT TUD EXT.2** Trusted Update based on certificates

# FPT\_TUD\_EXT.2 Trusted Update based on certificates

**FPT\_TUD\_EXT.2.1** The TSF shall not install an update if the code signing certificate is deemed invalid.

**FPT\_TUD\_EXT.2.2** When the certificate is deemed invalid because the certificate has expired, the TSF shall [selection: *allow the Administrator to choose whether to accept the certificate in these cases, accept the certificate, not accept the certificate*].

# Application Note 130

Certificates may optionally be used for code signing of system software updates (FPT\_TUD\_EXT.1.3). This element must be included in the ST if certificates are used for validating updates. If "code signing for system software updates" is selected in FIA\_X509\_EXT.2.1, FPT\_TUD\_EXT.2 must be included in the ST. The use of X.509 certificates is not applicable if only published hashes are supported for trusted updates.

Validity is determined by the certification path, the expiration date, and the revocation status in accordance with FIA\_X509\_EXT.1/Rev. For expired certificates the author of the ST selects whether the certificate shall be accepted, rejected or the choice is left to the Administrator to accept or reject the certificate.

# **B.6** Security Management (FMT)

# **B.6.1** Management of functions in TSF (FMT MOF)

# **B.6.1.1 FMT MOF.1/Services** Management of security functions behaviour

# FMT MOF.1/Services

# Management of security functions behaviour

**FMT\_MOF.1.1/Services** The TSF shall restrict the ability to <u>enable and disable</u> **start and stop** the functions services to *Security Administrators*.

# Application Note 131

FMT\_MOF.1/Services should only be chosen if the Security Administrator has the ability to start and stop services and the corresponding option has been selected in FMT\_SMF.1.

In FMT\_MOF.1.1/Services 'enable and disable' have been refined to 'start and stop' and 'the functions: [assignment: list of functions]' has been refined to 'services'.

# B.6.1.2 FMT\_MOF.1/AutoUpdate Management of security functions behaviour

# FMT MOF.1/AutoUpdate Management of security functions behaviour

**FMT\_MOF.1.1/AutoUpdate** The TSF shall restrict the ability to [selection: <u>enable</u>, <u>disable</u>] the functions [selection: automatic checking for updates, automatic update] to Security Administrators.

### **Application Note 132**

FMT\_MOF.1/AutoUpdate is only applicable if the TOE supports automatic checking for updates and/or automatic updates and allows them to be enabled and disabled. Enable and disable of automatic checking for updates and/or automatic updates is restricted to Security Administrators. The option "automatic update" may only be selected if digital signatures are used to validate the trusted update.

# B.6.1.3 FMT MOF.1/Functions Management of security functions behaviour

# FMT MOF.1/Functions Management of security functions behaviour

**FMT\_MOF.1.1/Functions** The TSF shall restrict the ability to [selection: <u>determine the behaviour of, modify the behaviour of]</u> the functions [selection: transmission of audit data to an external IT entity, handling of audit data, audit functionality when Local Audit Storage Space is full] to Security Administrators.

# Application Note 133

*FMT MOF.1/Functions should be chosen if one or more of the following scenarios apply:* 

- If the transmission protocol for transmission of audit data to an external IT entity as defined in FAU\_STG\_EXT.1.1 is configurable, "transmission of audit data to an external IT entity" shall be chosen.
- If the handling of audit data is configurable, "handling of audit data" shall be chosen. The term "handling of audit data" refers to the different options for selection and

assignments in SFRs FAU\_STG\_EXT.1.2, FAU\_STG\_EXT.1.3 and FAU\_STG\_EXT.2/LocSpace.

• If the behaviour of the audit functionality is configurable when Local Audit Storage Space is full, "audit functionality when Local Audit Storage Space is full" shall be chosen.

The first selection for "determine the behaviour of" and "modify the behaviour of" should be done as appropriate. It might be necessary to have different selections for the first selection depending on the second selection (e.g. "handling of audit data" might require "determine the behaviour of" and "modify the behaviour of" for the first selection on the one hand and "TOE Security Functions" might require "modify the behaviour of" only). In that case FMT\_MOF.1/Functions should be iterated with increasing number appended (i.e. FMT MOF.1/Functions1, FMT MOF.1/Functions2, etc.).

# **B.6.2** Management of TSF data (FMT\_MTD)

# B.6.2.1 FMT MTD.1/CryptoKeys Management of TSF data

# FMT\_MTD.1/CryptoKeys Management of TSF data

**FMT\_MTD.1.1/CryptoKeys** The TSF shall restrict the ability to <u>manage</u> the <u>cryptographic</u> keys to Security Administrators.

# **Application Note 134**

FMT\_MTD.1.1/CryptoKeys restricts management of cryptographic keys to Security Administrators. It should only be chosen if cryptographic keys can be managed (e.g. modified, deleted or generated/imported) by the Security Administrator. The identifier "CryptoKeys" has been added here to separate this iteration of FMT\_MTD.1 from the mandatory iteration of FMT\_MTD.1 defined in Chapter 6.6.2.1 (FMT\_MTD.1/CoreData).

# C. Extended Component Definitions

This appendix contains the definitions for the extended requirements that are used in the cPP, including those used in Appendices A and B.

(Note: formatting conventions for selections and assignments in this Appendix are those in [CC2].)

# C.1 Security Audit (FAU)

# C.1.1 Security Audit Data Generation (FAU GEN EXT)

# **Family Behaviour**

This component defines the requirements for components in a distributed TOE to generate security audit data.

# **Component levelling**

FAU\_GEN\_EXT.1 Security audit data shall be generated by all components in a distributed TOE

# Management: FAU\_GEN\_EXT.1

The following actions could be considered for the management functions in FMT:

a) The TSF shall have the ability to configure the cryptographic functionality.

# **Audit: FAU GEN EXT.1**

The following actions should be auditable if FAU\_GEN Security audit data generation is included in the PP/ST:

a) No audit necessary.

# C.1.1.1 FAU\_ GEN\_EXT.1 Security Audit Data Generation for Distributed TOE Components

# FAU GEN EXT.1 Security Audit Data Generation

Hierarchical to: No other components.

Dependencies: None.

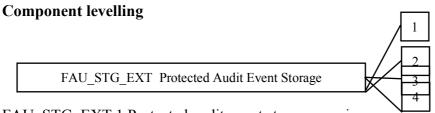

**FAU\_GEN\_EXT.1.1**. The TSF shall be able to generate audit records for each TOE component. The audit records generated by the TSF of each TOE component shall include the subset of security relevant audit events which can occur on the TOE component.

The TOE must be able to generate audit records for each TOE component. Some TOE components of a distributed TOE might not implement the complete TSF of the overall TOE but only a subset of the TSF. The audit records for each TOE component need to cover all security relevant audit events according to the subset of the TSF implemented by this particular TOE component but not necessarily all security relevant audit events according to the TSF of the overall TOE. If a security-relevant event can occur on multiple TOE components, it needs to cause generation of an audit record uniquely identifying the component associated with the event. The ST author shall identify for each TOE component which of the overall required audit events defined in FAU\_GEN.1.1 are logged. The ST author may decide to do this by providing a corresponding table. The information provided needs to be in agreement with Table 1. The overall TOE needs to cover all auditable events listed in Table 2 (and Tables 4 and 5 as applicable to the overall TOE).

# **C.1.2** Protected audit event storage (FAU STG EXT)

# **Family Behaviour**

This component defines the requirements for the TSF to be able to securely transmit audit data between the TOE and an external IT entity.

FAU\_STG\_EXT.1 Protected audit event storage requires channel implementing a secure protocol.

the TSF to use a trusted

FAU\_STG\_EXT.2 Counting lost audit data requires the TSF to provide information about audit records affected when the audit log becomes full.

FAU\_STG\_EXT.3 Protected Local audit event storage for distributed TOEs requires the TSF to use a trusted channel to protect audit transfer to another TOE component.

FAU\_STG\_EXT.4 Protected Remote audit event storage for distributed TOEs requires the TSF to use a trusted channel to protect audit transfer to another TOE component.

# Management: FAU\_STG\_EXT.1, FAU\_STG\_EXT.2, FAU\_STG\_EXT.3, FAU\_STG\_EXT.4

The following actions could be considered for the management functions in FMT:

a) The TSF shall have the ability to configure the cryptographic functionality.

# Audit: FAU STG EXT.1, FAU STG EXT.2, FAU STG EXT.3, FAU STG EXT.4

The following actions should be auditable if FAU\_GEN Security audit data generation is included in the PP/ST:

a) No audit necessary.

# C.1.2.1 FAU\_STG\_EXT.1 Protected Audit Event Storage

# FAU STG EXT.1 Protected Audit Event Storage

Hierarchical to: No other components.

Dependencies: FAU\_GEN.1 Audit data generation

FTP\_ITC.1 Inter-TSF Trusted Channel

**FAU\_STG\_EXT.1.1** The TSF shall be able to transmit the generated audit data to an external IT entity using a trusted channel according to FTP ITC.

# **Application Note 136**

For selecting the option of transmission of generated audit data to an external IT entity the TOE relies on a non-TOE audit server for storage and review of audit records. The storage of these audit records and the ability to allow the Administrator to review these audit records is provided by the operational environment in that case. Since the external audit server is not part of the TOE, there are no requirements on it except the capabilities for ITC transport for audit data. No requirements are placed upon the format or underlying protocol of the audit data being transferred. The TOE must be capable of being configured to transfer audit data to an external IT entity without Administrator intervention. Manual transfer would not meet the requirements. Transmission could be done in real-time or periodically. If the transmission is not done in real-time then the TSS describes what event stimulates the transmission to be made and what range of frequencies the TOE supports for making transfers of audit data to the audit server; the TSS also suggests typical acceptable frequencies for the transfer.

For distributed TOEs each component must be able to export audit data across a protected channel external (FTP\_ITC.1) or intercomponent (FPT\_ITT.1 or FTP\_ITC.1) as appropriate. At least one component of the TOE must be able to export audit records via FTP\_ITC.1 such that all TOE audit records can be exported to an external IT entity.

**FAU\_STG\_EXT.1.2** The TSF shall be able to store generated audit data on the TOE itself. [selection:

- *TOE shall consist of a single standalone component that stores audit data locally,*
- The TOE shall be a distributed TOE that stores audit data on the following TOE components: [assignment: identification of TOE components],
- The TOE shall be a distributed TOE with storage of audit data provided externally for the following TOE components: [assignment: list of TOE components that do not store audit data locally and the other TOE components to which they transmit their generated audit data].

If the TOE is a standalone TOE (i.e. not a distributed TOE) the option 'The TOE shall consist of a single standalone component that stores audit data locally' shall be selected.

If the TOE is a distributed TOE the option 'The TOE shall be a distributed TOE that stores audit data on the following TOE components: [assignment: identification of TOE components]' shall be selected and the TOE components which store audit data locally shall be listed in the assignment. Since all TOEs are required to provide functions to store audit data locally this option needs to be selected for all distributed TOEs. In addition, FAU\_GEN\_EXT.1 and FAU\_STG\_EXT.3 shall be claimed in the ST. If the distributed TOE consists only of components which are storing audit data locally, it is sufficient to select only the option 'The TOE shall be a distributed TOE that stores audit data on the following TOE components: [assignment: identification of TOE components]' and add FAU\_GEN\_EXT.1 and FAU\_STG\_EXT.3.

If the TOE is a distributed TOE and some TOE components are not storing audit data locally, the option 'The TOE shall be a distributed TOE with storage of audit data provided externally for the following TOE components: [assignment: list of TOE components that do not store audit data locally and the other TOE components to which they transmit their generated audit data]' shall be selected in addition to the option 'The TOE shall be a distributed TOE that stores audit data on the following TOE components: [assignment: identification of TOE components]'. In that case FAU\_STG\_EXT.4 shall be claimed in the ST in addition to FAU\_GEN\_EXT.1 and FAU\_STG\_EXT.3. For the option 'The TOE shall be a distributed TOE with storage of audit data provided externally for the following TOE components: [assignment: list of TOE components that do not store audit data locally and the other TOE components to which they transmit their generated audit data]' the TOE components that to not store audit data locally shall be mapped to the TOE components to which they transmit their generated audit data.

For distributed TOEs this SFR can be fulfilled either by every TOE component storing its own security audit data locally or by one or more TOE components storing audit data locally and other TOE components which are not storing audit information locally sending security audit data to other TOE components for local storage. For the transfer of security audit data between TOE components a protected channel according to FTP\_ITC.1 or FPT\_ITT.1 shall be used. The TSS shall describe which TOE components store security audit data locally and which TOE components do not store security audit data locally. For the latter, the TSS shall describe at which other TOE component the audit data is stored locally.

**FAU\_STG\_EXT.1.3** The TSF shall [selection: drop new audit data, overwrite previous audit records according to the following rule: [assignment: rule for overwriting previous audit records], [assignment: other action]] when the local storage space for audit data is full.

# Application Note 138

The external log server might be used as alternative storage space in case the local storage space is full. The "other action" could in this case be defined as "send the new audit data to an external IT entity".

For distributed TOEs each component is not required to store generated audit data locally but the overall TOE needs to be able to store audit data locally. Each component must at least provide the ability to temporarily buffer audit information locally to ensure that audit records are preserved in case of network connectivity issues. Buffering audit information locally, does

not necessarily involve non-volatile memory: audit information could be buffered in volatile memory. However, the local storage of audit information in the sense of FAU\_STG\_EXT.1.3 needs to be done in non-volatile memory. For every component which performs local storage of audit information, the behaviour when local storage is exhausted needs to be described. For every component which is buffering audit information instead of storing audit information locally itself, it needs to be described what happens in case the buffer space is exhausted.

# C.1.2.2 FAU\_STG\_EXT.2 Counting lost audit data

# FAU STG EXT.2 Counting lost audit data

Hierarchical to: No other components.

Dependencies: FAU\_GEN.1 Audit data generation

FAU STG EXT.1 External Audit Trail Storage

**FAU\_STG\_EXT.2.1** The TSF shall provide information about the number of [selection: *dropped, overwritten, [assignment: other information]*] audit records in the case where the local storage has been filled and the TSF takes one of the actions defined in FAU STG EXT.1.3.

# **Application Note 139**

This option should be chosen if the TOE supports this functionality.

In case the local storage for audit records is cleared by the Administrator, the counters associated with the selection in the SFR should be reset to their initial value (most likely to 0). The guidance documentation should contain a warning for the Administrator about the loss of audit data when he clears the local storage for audit records.

For distributed TOEs each component that implements counting of lost audit data has to provide a mechanism for Administrator access to, and management of, this information.

If FAU\_STG\_EXT.2 is added to the ST, the ST has to make clear any situations in which lost audit data is not counted.

# C.1.2.3 FAU STG EXT.3 Protected Local Audit Event Storage for Distributed TOEs

# Hierarchical to: No other components. Dependencies: FAU\_GEN\_EXT.1 Security Audit data generation for Distributed TOE Components [FPT\_ITT.1 Intra-TSF Trusted Channel or FTP\_ITC.1 Inter-TSF Trusted Channel]

**FAU\_STG\_EXT.3.1** The TSF of each TOE component which stores security audit data locally shall perform the following actions when the local storage space for audit data is full: [assignment: table of components and for each component its action chosen according to the

following: [selection: drop new audit data, overwrite previous audit records according to the following rule: [assignment: rule for overwriting previous audit records], [assignment: other action]].

# Application Note 140

If a component of a distributed TOE collects data from other components and then forwards it to another component or external IT entity (cf. FAU\_STG\_EXT.1.1) then the operations in this SFR must be performed in a way to cover the storage space action(s) for all of the audit data that the TOE collects (i.e. not just for the data generated by the collecting component for itself).

It is acceptable for a TOE component to store audit information in multiple places (e.g. for redundancy), whether locally in the TOE component itself and in another TOE component, or in more than one other TOE component.

TOE components are not required to monitor or audit connectivity or network outages between TOE components. This aspect is covered by the assumption A.COMPONENTS RUNNING.

# C.1.2.4FAU\_STG\_EXT.4 Protected Remote Audit Event Storage for Distributed TOEs

# Hierarchical to: No other components. PAU\_GEN\_EXT.1 Security Audit data generation for Distributed TOE Components [FPT\_ITT.1 Intra-TSF Trusted Channel or FTP ITC.1 Inter-TSF Trusted Channel]

**FAU\_STG\_EXT.4.1** Each TOE component which does not store security audit data locally shall be able to buffer security audit data locally until it has been transferred to another TOE component that stores or forwards it. All transfer of audit records between TOE components shall use a protected channel according to *[selection: FPT\_ITT.1, FTP\_ITC.1]*.

# Application Note 141

If a component of a distributed TOE collects data from other components and then forwards it to another component or external IT entity (cf. FAU\_STG\_EXT.1.1) then the operations in this SFR must be performed in a way to cover the storage space action(s) for all of the audit data that the TOE collects (i.e. not just for the data generated by the collecting component for itself).

It is acceptable for a TOE component to store audit information in multiple places (e.g. for redundancy), whether locally in the TOE component itself and in another TOE component, or in more than one other TOE component.

TOE components are not required to monitor or audit connectivity or network outages between TOE components. This aspect is covered by the assumption A.COMPONENTS\_RUNNING.

# **C.2** Cryptographic Support (FCS)

# **C.2.1** Random Bit Generation (FCS\_RBG\_EXT)

# C.2.1.1 FCS\_RBG\_EXT.1 Random Bit Generation

# **Family Behaviour**

Components in this family address the requirements for random bit/number generation. This is a new family defined for the FCS class.

# **Component levelling**

FCS\_RBG\_EXT Random Bit Generation 1

FCS\_RBG\_EXT.1 Random Bit Generation requires random bit generation to be performed in accordance with selected standards and seeded by an entropy source.

# Management: FCS RBG EXT.1

The following actions could be considered for the management functions in FMT:

a) There are no management activities foreseen

# Audit: FCS\_RBG\_EXT.1

The following actions should be auditable if FAU\_GEN Security audit data generation is included in the PP/ST:

a) Minimal: failure of the randomization process

# FCS RBG EXT.1 Random Bit Generation

Hierarchical to: No other components

Dependencies: No other components

**FCS\_RBG\_EXT.1.1** The TSF shall perform all deterministic random bit generation services in accordance with ISO/IEC 18031:2011 using [selection: *Hash\_DRBG (any), HMAC\_DRBG (any), CTR\_DRBG (AES)*].

FCS\_RBG\_EXT.1.2 The deterministic RBG shall be seeded by at least one entropy source that accumulates entropy from [selection: [assignment: number of software-based sources] software-based noise source, [assignment: number of hardware-based sources] hardware-based noise source] with a minimum of [selection: 128 bits, 192 bits, 256 bits] of entropy at least equal to the greatest security strength, according to ISO/IEC 18031:2011 Table C.1 "Security Strength Table for Hash Functions", of the keys and hashes that it will generate.

For the first selection in FCS\_RBG\_EXT.1.2, the ST author selects at least one of the types of noise sources. If the TOE contains multiple noise sources of the same type, the ST author fills the assignment with the appropriate number for each type of source (e.g., 2 software-based noise sources, 1 hardware-based noise source). The documentation and tests required in the Evaluation Activity for this element should be repeated to cover each source indicated in the ST.

ISO/IEC 18031:2011 contains three different methods of generating random numbers; each of these, in turn, depends on underlying cryptographic primitives (hash functions/ciphers). The ST author will select the function used and include the specific underlying cryptographic primitives used in the requirement. While any of the identified hash functions (SHA-1, SHA-256, SHA-384, SHA-512) are allowed for Hash\_DRBG or HMAC\_DRBG, only AES-based implementations for CTR\_DRBG are allowed.

If the key length for the AES implementation used here is different than that used to encrypt the user data, then FCS\_COP.1 may have to be adjusted or iterated to reflect the different key length. For the selection in FCS\_RBG\_EXT.1.2, the ST author selects the minimum number of bits of entropy that is used to seed the RBG, which must be equal or greater than the security strength of any key generated by the TOE.

C.2.2 Cryptographic Protocols (FCS\_DTLSC\_EXT, FCS\_DTLSS\_EXT, FCS\_HTTPS\_EXT, FCS\_IPSEC\_EXT, FCS\_NTP\_EXT, FCS\_SSHC\_EXT, FCS\_SSHS\_EXT, FCS\_TLSC\_EXT, FCS\_TLSS\_EXT)

# C.2.2.1 FCS DTLSC EXT DTLS Client Protocol

# **Family Behaviour**

The component in this family addresses the ability for a client to use DTLS to protect data between the client and a server using the DTLS protocol.

# **Component levelling**

FCS\_DTLSC\_EXT.1 DTLS Client requires that the client side of DTLS be implemented as specified.

FCS\_DTLSC\_EXT.2 DTLS Client requires that the client side of the DTLS implementation include mutual authentication.

# Management: FCS DTLSC EXT.1, FCS DTLSC EXT.2

The following actions could be considered for the management functions in FMT:

a) There are no management activities foreseen.

# Audit: FCS DTLSC EXT.1, FCS DTLSC EXT.2

The following actions should be considered for audit if FAU\_GEN Security audit data generation is included in the PP/ST:

- a) Failure of DTLS session establishment
- b) DTLS session establishment
- c) DTLS session termination

# Hierarchical to: No other components FCS\_CKM. 1DataEncryption1 Cryptographic Key Generation FCS\_CKM.2 Cryptographic Key Establishment FCS\_COP.1/DataEncryption Cryptographic operation (AES Data encryption/decryption) FCS\_COP.1/SigGen1SigGen Cryptographic operation (Signature Generation and Verification) FCS\_COP.1/Hash Cryptographic operation (Hash Algorithm) FCS\_COP.1/KeyedHash Cryptographic operation (Keyed Hash

**FCS\_DTLSC\_EXT.1.1** The TSF shall implement [selection: *DTLS 1.2 (RFC 6347), DTLS 1.0 (RFC 4347)*] supporting the following ciphersuites:

• [assignment: List of optional ciphersuites and reference to RFC in which each is defined]

FCS RBG EXT.1 Random Bit Generation

# **Application Note 143**

The ciphersuites to be tested in the evaluated configuration are limited by this requirement. The ST author should select the ciphersuites that are supported.

These requirements will be revisited as new DTLS versions are standardized by the IETF.

*In a future version of this cPP DTLS v1.2 will be required for all TOEs.* 

Algorithm)

**FCS\_DTLSC\_EXT.1.2** The TSF shall verify that the presented identifier matches the reference identifier according to RFC 6125 section 6.

# Application Note 144

The rules for verification of identity are described in Section 6 of RFC 6125. The reference identifier is established by the Administrator (e.g. entering a URL into a web browser or clicking a link), by configuration (e.g. configuring the name of a mail server or authentication server), or by an application (e.g. a parameter of an API) depending on the application service. Based on a singular reference identifier's source domain and application service type (e.g. HTTP, SIP, LDAP), the client establishes all reference identifiers which are acceptable, such as a Common Name for the Subject Name field of the certificate and a (case-insensitive) DNS name, URI name, and Service Name for the Subject Alternative Name

field. The client then compares this list of all acceptable reference identifiers to the presented identifiers in the DTLS server's certificate.

The preferred method for verification is the Subject Alternative Name using DNS names, URI names, or Service Names. Verification using the Common Name is required for the purposes of backwards compatibility. Additionally, support for use of IP addresses in the Subject Name or Subject Alternative name is discouraged as against best practices but may be implemented. Finally, the client should avoid constructing reference identifiers using wildcards. However, if the presented identifiers include wildcards, the client must follow the best practices regarding matching; these best practices are captured in the evaluation activity.

**FCS\_DTLSC\_EXT.1.3** When establishing a trusted channel, by default the TSF shall not establish a trusted channel if the server certificate is invalid. The TSF shall also [selection:

- Not implement any administrator override mechanism
- require administrator authorization to establish the connection if the TSF fails to [selection: match the reference identifier, validate certificate path, validate expiration date, determine the revocation status] of the presented server certificate

].

# **Application Note 145**

"Revocation status" refers to a OCSP or CRL response that indicates the presented certificate is invalid. Inability to make a connection to determine validity shall be handled as specified in FIA X509 EXT.2.2.

If DTLS is selected in FTP\_ITC then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/Rev.

If DTLS is selected in FPT\_ITT, then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/ITT.

**FCS\_DTLSC\_EXT.1.4** The TSF shall [selection: not present the Supported Elliptic Curves Extension, present the Supported Elliptic Curves Extension with the following NIST curves: [selection: secp256r1, secp384r1, secp521r1] and no other curves] in the Client Hello.

# **Application Note 146**

If ciphersuites with elliptic curves were selected in FCS\_DTLSC\_EXT.1.1, a selection of one or more curves is required. If no ciphersuites with elliptic curves were selected in FCS\_DTLS\_EXT.1.1, then "not present the Supported Elliptic Curves Extension" should be selected.

This requirement limits the elliptic curves allowed for authentication and key agreement to the NIST curves from FCS\_COP.1/SigGen and FCS\_CKM.1 and FCS\_CKM.2. This extension is required for clients supporting Elliptic Curve ciphersuites.

# FCS DTLSC EXT.2 DTLS C

**DTLS Client Protocol with Authentication** 

Hierarchical to: FCS DTLSC EXT.1 DTLS Client Protocol

Dependencies: FCS CKM.1/DataEncryption Cryptographic Key Generation

FCS\_CKM.2 Cryptographic Key Establishment

FCS\_COP.1/DataEncryption Cryptographic operation (AES

Data encryption/decryption)

FCS COP.1/SigGen Cryptographic operation (Signature

Generation and Verification)

FCS\_COP.1/Hash Cryptographic operation (Hash Algorithm) FCS COP.1/KeyedHash Cryptographic operation (Keyed Hash

Algorithm)

FCS RBG EXT.1 Random Bit Generation

**FCS\_DTLSC\_EXT.2.1** The TSF shall implement [selection: *DTLS 1.2 (RFC 6347), DTLS 1.0 (RFC 4347)*] supporting the following ciphersuites:

• [assignment: List of optional ciphersuites and reference to RFC in which each is defined].

# Application Note 147

*The ST author should select the ciphersuites that are supported.* 

These requirements will be revisited as new DTLS versions are standardized by the IETF.

*In a future version of this cPP DTLS v1.2 will be required for all TOEs.* 

FCS\_DTLSC\_EXT.2.2 The TSF shall verify that the presented identifier matches the reference identifier according to RFC 6125 section 6.

# **Application Note 148**

The rules for verification of identity are described in Section 6 of RFC 6125. The reference identifier is established by the Administrator (e.g. entering a URL into a web browser or clicking a link), by configuration (e.g. configuring the name of a mail server or authentication server), or by an application (e.g. a parameter of an API) depending on the application service. Based on a singular reference identifier's source domain and application service type (e.g. HTTP, SIP, LDAP), the client establishes all reference identifiers which are acceptable, such as a Common Name for the Subject Name field of the certificate and a (case-insensitive) DNS name, URI name, and Service Name for the Subject Alternative Name field. The client then compares this list of all acceptable reference identifiers to the presented identifiers in the DTLS server's certificate.

FCS\_DTLSC\_EXT.2.3 When establishing a trusted channel, by default the TSF shall not establish a trusted channel if the server certificate is invalid. The TSF shall also [selection:

- Not implement any administrator override mechanism
- require administrator authorization to establish the connection if the TSF fails to [selection: match the reference identifier, validate certificate path, validate expiration date, determine the revocation status] of the presented server certificate

].

"Revocation status" refers to a OCSP or CRL response that indicates the presented certificate is invalid. Inability to make a connection to determine validity shall be handled as specified in FIA\_X509\_EXT.2.2.

If DTLS is selected in FTP\_ITC then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/Rev.

If DTLS is selected in FPT\_ITT, then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/ITT.

**FCS\_DTLSC\_EXT.2.4** The TSF shall [selection: not present the Supported Elliptic Curves Extension, present the Supported Elliptic Curves Extension with the following NIST curves: [selection: secp256r1, secp384r1, secp521r1] and no other curves] in the Client Hello].

# Application Note 150

If ciphersuites with elliptic curves were selected in FCS\_DTLSC\_EXT.2.1, a selection of one or more curves is required. If no ciphersuites with elliptic curves were selected in FCS\_DTLS\_EXT.2.1, then "not present the Supported Elliptic Curves Extension" should be selected.

This requirement limits the elliptic curves allowed for authentication and key agreement to the NIST curves from FCS\_COP.1/SigGen and FCS\_CKM.1 and FCS\_CKM.2. This extension is required for clients supporting Elliptic Curve ciphersuites.

FCS\_DTLSC\_EXT.2.5 The TSF shall support mutual authentication using X.509v3 certificates.

# Application Note 151

The use of X.509v3 certificates for TLS is addressed in FIA\_X509\_EXT.2.1. This requirement adds that this use must include the client must be capable of presenting a certificate to a DTLS server for DTLS mutual authentication.

**FCS\_DTLSC\_EXT.2.6** The TSF shall [selection: *terminate the DTLS session, silently discard the record*] if a message received contains an invalid MAC.

# Application Note 152

The Message Authentication Code (MAC) is negotiated during DTLS handshake phase and is used to protect integrity of messages received from the sender during DTLS data exchange. If MAC verification fails, the session must be terminated or the record must be silently discarded. FCS DTLSC EXT.2.7 The TSF shall detect and silently discard replayed messages for:

- DTLS records previously received.
- DTLS records too old to fit in the sliding window.

# Application Note 153

Replay Detection is described in section 4.1.2.6 of DTLS 1.2 (RFC 6347) and section 4.1.2.5 of DTLS 1.0 (RFC 4347). For each received record, the receiver verifies the record contains a sequence number is within the sliding receive window and does not duplicate the sequence number of any other record received during the session.

"Silently Discard" means the TOE discards the packet responding.

# C.2.2.2 FCS\_DTLSS\_EXT DTLS Server Protocol

# **Family Behaviour**

The component in this family addresses the ability for a server to use DTLS to protect data between a client and the server using the DTLS protocol.

# **Component levelling**

FCS\_DTLSS\_EXT.1 DTLS Server requires that the server side of TLS be implemented as specified.

FCS\_DTLSS\_EXT.2: DTLS Server requires the mutual authentication be included in the DTLS implementation.

# Management: FCS DTLSS EXT.1, FCS DTLSS EXT.2

The following actions could be considered for the management functions in FMT:

a) There are no management activities foreseen.

# Audit: FCS\_DTLSS\_EXT.1, FCS\_DTLSS\_EXT.2

The following actions should be considered for audit if FAU\_GEN Security audit data generation is included in the PP/ST:

- a) Failure of DTLS session establishment.
- b) DTLS session establishment
- c) DTLS session termination

# FCS DTLSS EXT.1 DTLS Server Protocol

Hierarchical to: No other components

Dependencies: FCS\_CKM.1 Cryptographic Key Generation

FCS\_CKM.2 Cryptographic Key Establishment

FCS COP.1//DataEncryption Cryptographic operation (AES

Data encryption/decryption)

FCS\_COP.1//SigGen Cryptographic operation (Signature

Generation and Verification)

FCS\_COP.1/Hash Cryptographic operation (Hash Algorithm) FCS\_COP.1/KeyedHash Cryptographic operation (Keyed Hash

Algorithm)

FCS\_RBG\_EXT.1 Random Bit Generation

**FCS\_DTLSS\_EXT.1.1** The TSF shall implement [selection: *DTLS 1.2 (RFC 6347), DTLS 1.0 (RFC 4347)*] supporting the following ciphersuites:

• [assignment: List of optional ciphersuites and reference to RFC in which each is defined]

# **Application Note 154**

The ciphersuites to be tested in the evaluated configuration are limited by this requirement. The ST author should select the ciphersuites that are supported.

These requirements will be revisited as new DTLS versions are standardized by the IETF.

*In a future version of this cPP DTLS v1.2 will be required for all TOEs.* 

**FCS\_DTLSS\_EXT.1.2** The TSF shall deny connections from clients requesting [assignment: *list of protocol versions*].

# **Application Note 155**

This version of the cPP does not require the TOE to deny DTLS v1.0. In a future version of this cPP DTLS v1.0 will be required to be denied for all TOEs.

**FCS\_DTLSS\_EXT.1.3** The TSF shall not proceed with a connection handshake attempt if the DTLS Client fails validation.

# **Application Note 156**

The process to validate the IP address of a DTLS client is specified in section 4.2.1 of RFC 6347 (DTLS 1.2) and RFC 4347 (DTLS 1.0). The TOE validates the DTLS client during Connection Establishment (Handshaking) and prior to the TSF sending a Server Hello message. After receiving a ClientHello, the DTLS Server sends a HelloVerifyRequest along with a cookie. The cookie is a signed message using the keyed hash function specified in FCS\_COP.1 /KeyedHash. The DTLS Client then sends another ClientHello with the cookie attached. If the DTLS server successfully verifies the signed cookie, the Client is not using a spoofed IP address.

**FCS\_DTLSS\_EXT.1.4** The TSF shall [selection: perform RSA key establishment with key size [selection: 2048 bits, 3072 bits, 4096 bits]; generate EC Diffie-Hellman parameters over NIST curves [selection: secp256r1, secp384r1, secp521r1] and no other curves; generate Diffie-Hellman parameters of size [selection: 2048 bits, 3072 bits]].

# Application Note 157

If the ST lists a DHE or ECDHE ciphersuite in FCS\_DTLSS\_EXT.1.1, the ST must include the Diffie-Hellman or NIST curves selection in the requirement. FMT\_SMF.1 requires the configuration of the key agreement parameters in order to establish the security strength of the DTLS connection.

**FCS\_DTLSS\_EXT.1.5** The TSF shall [selection: *terminate the DTLS session, silently discard the record*] if a message received contains an invalid MAC.

The Message Authentication Code (MAC) is negotiated during DTLS handshake phase and is used to protect integrity of messages received from the sender during DTLS data exchange. If MAC verification fails, the session must be terminated or the record must be silently discarded. FCS DTLSS EXT.1.6 The TSF shall detect and silently discard replayed messages for:

- DTLS records previously received.
- DTLS records too old to fit in the sliding window.

# Application Note 159

Replay Detection is described in section 4.1.2.6 of DTLS 1.2 (RFC 6347) and section 4.1.2.5 of DTLS 1.0 (RFC 4347). For each received record, the receiver verifies the record contains a sequence number is within the sliding receive window and does not duplicate the sequence number of any other record received during the session.

"Silently Discard" means the TOE discards the packet without responding.

# FCS DTLSS EXT.2

# **DTLS Server Protocol with mutual authentication**

Generation and Verification)

FCS\_COP.1/Hash Cryptographic operation (Hash Algorithm) FCS\_COP.1/KeyedHash Cryptographic operation (Keyed Hash

Algorithm)

FCS RBG EXT.1 Random Bit Generation

**FCS\_DTLSS\_EXT.2.1** The TSF shall implement [selection: *DTLS 1.2 (RFC 6347), DTLS 1.0 (RFC 4347)*] supporting the following ciphersuites:

• [assignment: List of optional ciphersuites and reference to RFC in which each is defined].

# **Application Note 160**

The ciphersuites to be tested in the evaluated configuration are limited by this requirement. The ST author should select the ciphersuites that are supported.

These requirements will be revisited as new DTLS versions are standardized by the IETF.

*In a future version of this cPP DTLS v1.2 will be required for all TOEs.* 

**FCS\_DTLSS\_EXT.2.2** The TSF shall deny connections from clients requesting [assignment: *list of protocol versions*].

This version of the cPP does not require the TOE to deny DTLS v1.0. In a future version of this cPP DTLS v1.0 will be required to be denied for all TOEs.

**FCS\_DTLSS\_EXT.2.3** The TSF shall not proceed with a connection handshake attempt if the DTLS Client fails validation.

# Application Note 162

The process to validate the IP address of a DTLS client is specified in section 4.2.1 of RFC 6347 (DTLS 1.2) and RFC 4347 (DTLS 1.0). The TOE validates the DTLS client during Connection Establishment (Handshaking) and prior to the TSF sending a Server Hello message. After receiving a ClientHello, the DTLS Server sends a HelloVerifyRequest along with a cookie. The cookie is a signed message using the keyed hash function specified in FCS\_COP.1/KeyedHash. The DTLS Client then sends another ClientHello with the cookie attached. If the DTLS server successfully verifies the signed cookie, the Client is not using a spoofed IP address.

**FCS\_DTLSS\_EXT.2.4** The TSF shall [selection: perform RSA key establishment with key size [selection: 2048 bits, 3072 bits, 4096 bits]; generate EC Diffie-Hellman parameters over NIST curves [selection: secp256r1, secp384r1, secp521r1] and no other curves; generate Diffie-Hellman parameters of size [selection: 2048 bits, 3072 bits]].

# **Application Note 163**

If the ST lists a DHE or ECDHE ciphersuite in FCS\_DTLSS\_EXT.2.1, the ST must include the Diffie-Hellman or NIST curves selection in the requirement. FMT\_SMF.1 requires the configuration of the key agreement parameters in order to establish the security strength of the DTLS connection.

**FCS\_DTLSS\_EXT.2.5** The TSF shall [selection: *terminate the DTLS session, silently discard the record*] if a message received contains an invalid MAC.

# **Application Note 164**

The Message Authentication Code (MAC) is negotiated during the DTLS handshake phase and is used to protect integrity of messages received from the sender during DTLS data exchange. If MAC verification fails, the session must be terminated or the record must be silently discarded.

FCS DTLSS EXT.2.6 The TSF shall detect and silently discard replayed messages for:

- DTLS records that have previously been received.
- DTLS records too old to fit in the sliding window.

# Application Note 165

Replay Detection is described in section 4.1.2.6 of DTLS 1.2 (RFC 6347) and section 4.1.2.5 of DTLS 1.0 (RFC 4347). For each received record, the receiver verifies the record contains a sequence number is within the sliding receive window and does not duplicate the sequence number of any other record received during the session.

"Silently Discard" means the TOE discards the packet without responding.

FCS\_DTLSS\_EXT.2.7 The TSF shall support mutual authentication of DTLS clients using X 509v3 certificates

# **Application Note 166**

The use of X.509v3 certificates for DTLS is addressed in FIA\_X509\_EXT.2.1. This requirement adds that this use must include support for client-side certificates for DTLS mutual authentication.

FCS\_DTLSS\_EXT.2.8 When establishing a trusted channel, by default the TSF shall not establish a trusted channel if the client certificate is invalid. The TSF shall also [selection:

- Not implement any administrator override mechanism
- require administrator authorization to establish the connection if the TSF fails to [selection: match the reference identifier, validate certificate path, validate expiration date, determine the revocation status] of the presented client certificate

].

# Application Note 167

"Revocation status" refers to a OCSP or CRL response that indicates the presented certificate is invalid. Inability to make a connection to determine validity shall be handled as specified in FIA X509 EXT.2.2.

If DTLS is selected in FTP\_ITC then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/Rev.

If DTLS is selected in FPT\_ITT, then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/ITT.

FCS\_DTLSS\_EXT.2.9 The TSF shall not establish a trusted channel if the distinguished name (DN) or Subject Alternative Name (SAN) contained in a certificate does not match the expected identifier for the client.

# **Application Note 168**

The client identifier may be in the Subject field or the Subject Alternative Name extension of the certificate. The expected identifier may either be configured, may be compared to the Domain Name, IP address, username, or email address used by the peer, or may be passed to a directory server for comparison.

# C.2.2.3FCS\_HTTPS\_EXT.1 HTTPS Protocol

# Family Behaviour

Components in this family define the requirements for protecting remote management sessions between the TOE and a Security Administrator. This family describes how HTTPS will be implemented. This is a new family defined for the FCS Class.

#### **Component levelling**

FCS\_HTTPS\_EXT.1 HTTPS requires that HTTPS be implemented according to RFC 2818 and supports TLS.

#### **Management: FCS HTTPS EXT.1**

The following actions could be considered for the management functions in FMT:

a) There are no management activities foreseen.

#### **Audit: FCS HTTPS EXT.1**

The following actions should be auditable if FAU\_GEN Security audit data generation is included in the PP/ST:

a) There are no auditable events foreseen.

## Hierarchical to: No other components

Dependencies: [FCS\_TLSC\_EXT.1 TLS Client Protocol, or

FCS\_TLSS\_EXT.1 TLS Server Protocol]

**FCS\_HTTPS\_EXT.1.1** The TSF shall implement the HTTPS protocol that complies with RFC 2818.

FCS HTTPS EXT.1.2 The TSF shall implement the HTTPS protocol using TLS.

**FCS\_HTTPS\_EXT.1.3** If a peer certificate is presented, the TSF shall [selection: *not establish the connection, request authorization to establish the connection, [assignment: other action]*] if the peer certificate is deemed invalid.

#### C.2.2.4FCS\_IPSEC\_EXT.1 IPsec Protocol

#### **Family Behaviour**

Components in this family address the requirements for protecting communications using IPsec.

#### **Component levelling**

FCS IPSEC EXT.1 IPsec requires that IPsec be implemented as specified.

**Management: FCS IPSEC EXT.1** 

The following actions could be considered for the management functions in FMT:

a) Maintenance of SA lifetime configuration

#### **Audit: FCS IPSEC EXT.1**

The following actions should be considered for audit if FAU\_GEN Security audit data generation is included in the PP/ST:

- a) Decisions to DISCARD, BYPASS, PROTECT network packets processed by the TOE
- b) Failure to establish an IPsec SA
- c) IPsec SA establishment
- d) IPsec SA termination
- e) Negotiation "down" from an IKEv2 to IKEv1 exchange.

FCS_IPSEC_EXT.1	Internet Protocol Security (IPsec) Communications
Hierarchical to:	No other components
Dependencies:	FCS CKM.1 Cryptographic Key Generation
	FCS_CKM.2 Cryptographic Key Establishment
	FCS_COP.1/DataEncryption Cryptographic operation (AES
	Data encryption/decryption)
	FCS_COP.1/SigGen Cryptographic operation (Signature
	Generation and Verification)
	FCS_COP.1/Hash Cryptographic operation (Hash Algorithm)
	FCS_COP.1/KeyedHash Cryptographic operation (Keyed Hash
	Algorithm)
	FCS RBG EXT.1 Random Bit Generation

**FCS\_IPSEC\_EXT.1.1** The TSF shall implement the IPsec architecture as specified in RFC 4301.

#### **Application Note 169**

RFC 4301 calls for an IPsec implementation to protect IP traffic through the use of a Security Policy Database (SPD). The SPD is used to define how IP packets are to be handled: PROTECT the packet (e.g., encrypt the packet), BYPASS the IPsec services (e.g., no encryption), or DISCARD the packet (e.g., drop the packet). The SPD can be implemented in various ways, including router access control lists, firewall rulesets, a "traditional" SPD, etc. Regardless of the implementation details, there is a notion of a "rule" that a packet is "matched" against and a resulting action that takes place.

While there must be a means to order the rules, a general approach to ordering is not mandated, as long as the SPD can distinguish the IP packets and apply the rules accordingly. There may be multiple SPDs (one for each network interface), but this is not required.

FCS\_IPSEC\_EXT.1.2 The TSF shall have a nominal, final entry in the SPD that matches anything that is otherwise unmatched, and discards it.

**FCS IPSEC EXT.1.3** The TSF shall implement [selection: tunnel mode, transport mode].

FCS\_IPSEC\_EXT.1.4 The TSF shall implement the IPsec protocol ESP as defined by RFC 4303 using the cryptographic algorithms [selection: AES-CBC-128, AES-CBC-192, AES-CBC-256 (specified in RFC 3602), no other algorithm] together with a Secure Hash Algorithm (SHA)-based HMAC [selection: HMAC-SHA-1, HMAC-SHA-256, HMAC-SHA-384, HMAC-SHA-512, no other algorithm] and [selection: AES-GCM-128, AES-GCM-192, AES-GCM-256 (specified in RFC 4106), no other algorithm].

#### FCS IPSEC EXT.1.5 The TSF shall implement the protocol: [selection:

- IKEv1, using Main Mode for Phase 1 exchanges, as defined in RFCs 2407, 2408, 2409, RFC 4109, [selection: no other RFCs for extended sequence numbers, RFC 4304 for extended sequence numbers], and [selection: no other RFCs for hash functions, RFC 4868 for hash functions];
- IKEv2 as defined in RFCs 5996 [selection: with no support for NAT traversal, with mandatory support for NAT traversal as specified in RFC 5996, section 2.23)], and [selection: no other RFCs for hash functions, RFC 4868 for hash functions]].

**FCS\_IPSEC\_EXT.1.6** The TSF shall ensure the encrypted payload in the [selection: *IKEv1*, *IKEv2*] protocol uses the cryptographic algorithms [selection: *AES-CBC-128*, *AES\_CBC-192 AES-CBC-256* (specified in RFC 3602), AES-GCM-128, AES-GCM-192, AES-GCM-256 (specified in RFC 5282)].

#### Application Note 170

AES-GCM-128, AES-GCM-192 and AES-GCM-256 may only be selected if IKEv2 is also selected, as there is no RFC defining AES-GCM for IKEv1.

#### **FCS IPSEC EXT.1.7** The TSF shall ensure that [selection:

- *IKEv1 Phase 1 SA lifetimes can be configured by a Security Administrator based on [selection:* 
  - o number of bytes;
  - o length of time, where the time values can be configured within [assignment: integer range including 24] hours;

];

- *IKEv2 SA lifetimes can be configured by a Security Administrator based on [selection:* 
  - o number of bytes;
  - o length of time, where the time values can be configured within [assignment: integer range including 24] hours

1

].

#### Application Note 171

The ST author chooses either the IKEv1 requirements or IKEv2 requirements (or both, depending on the selection in FCS\_IPSEC\_EXT.1.5). The ST author chooses either volume-based lifetimes or time-based lifetimes (or a combination). This requirement must be accomplished by providing Security Administrator-configurable lifetimes (with appropriate instructions in documents mandated by AGD\_OPE). Hardcoded limits do not meet this requirement. In general, instructions for setting the parameters of the implementation, including lifetime of the SAs, should be included in the guidance documentation generated for AGD\_OPE.

#### FCS IPSEC EXT.1.8 The TSF shall ensure that [selection:

- IKEv1 Phase 2 SA lifetimes can be configured by a Security Administrator based on [selection:
  - o number of bytes;
  - o length of time, where the time values can be configured within [assignment: integer range including 8] hours;

];

- IKEv2 Child SA lifetimes can be configured by a Security Administrator based on [selection:
  - o number of bytes;
  - o length of time, where the time values can be configured within [assignment: integer range including 8] hours;

J

].

#### Application Note 172

The ST author chooses either the IKEv1 requirements or IKEv2 requirements (or both, depending on the selection in FCS\_IPSEC\_EXT.1.5). The ST author chooses either volume-based lifetimes or time-based lifetimes (or a combination). This requirement must be accomplished by providing Security Administrator-configurable lifetimes (with appropriate instructions in documents mandated by AGD\_OPE). Hardcoded limits do not meet this requirement. In general, instructions for setting the parameters of the implementation, including lifetime of the SAs, should be included in the guidance documentation generated for AGD\_OPE.

**FCS\_IPSEC\_EXT.1.9** The TSF shall generate the secret value x used in the IKE Diffie-Hellman key exchange ("x" in g<sup>x</sup> mod p) using the random bit generator specified in FCS\_RBG\_EXT.1, and having a length of at least [assignment: (one or more) number(s) of bits that is at least twice the security strength of the negotiated Diffie-Hellman group] bits.

#### **Application Note 173**

For DH groups 19 and 20, the "x" value is the point multiplier for the generator point G.

Since the implementation may allow different Diffie-Hellman groups to be negotiated for use in forming the SAs, the assignment in FCS\_IPSEC\_EXT.1.9 may contain multiple values. For each DH group supported, the ST author consults Table 2 in NIST SP 800-57

"Recommendation for Key Management – Part 1: General" to determine the security strength ("bits of security") associated with the DH group. Each unique value is then used to fill in the assignment for this element. For example, suppose the implementation supports DH group 14 (2048-bit MODP) and group 20 (ECDH using NIST curve P-384). From Table 2, the bits of security value for group 14 is 112, and for group 20 it is 192.

**FCS\_IPSEC\_EXT.1.10** The TSF shall generate nonces used in [selection: *IKEv1*, *IKEv2*] exchanges of length [selection:

- according to the security strength associated with the negotiated Diffie-Hellman group;
- at least 128 bits in size and at least half the output size of the negotiated pseudorandom function (PRF) hash
   ].

#### **Application Note 174**

The ST author must select the second option for nonce lengths if IKEv2 is also selected (as this is mandated in RFC 5996). The ST author may select either option for IKEv1.

For the first option for nonce lengths, since the implementation may allow different Diffie-Hellman groups to be negotiated for use in forming the SAs, the assignment in FCS\_IPSEC\_EXT.1.10 may contain multiple values. For each DH group supported, the ST author consults Table 2 in NIST SP 800-57 "Recommendation for Key Management —Part 1: General" to determine the security strength ("bits of security") associated with the DH group. Each unique value is then used to fill in the assignment for this element. For example, suppose the implementation supports DH group 14 (2048-bit MODP) and group 20 (ECDH using NIST curve P-384). From Table 2, the bits of security value for group 14 is 112, and for group 20 it is 192.

Because nonces may be exchanged before the DH group is negotiated, the nonce used should be large enough to support all TOE-chosen proposals in the exchange.

FCS\_IPSEC\_EXT.1.11 The TSF shall ensure that IKE protocols implement DH Group(s) [selection: 14 (2048-bit MODP), 19 (256-bit Random ECP), 20 (384-bit Random ECP), 24 (2048-bit MODP with 256-bit POS)].

**FCS\_IPSEC\_EXT.1.12** The TSF shall be able to ensure by default that the strength of the symmetric algorithm (in terms of the number of bits in the key) negotiated to protect the [selection: *IKEv1 Phase 1, IKEv2 IKE\_SA*] connection is greater than or equal to the strength of the symmetric algorithm (in terms of the number of bits in the key) negotiated to protect the [selection: *IKEv1 Phase 2, IKEv2 CHILD\_SA*] connection.

#### **Application Note 175**

The ST author chooses either or both of the IKE selections based on what is implemented by the TOE. Obviously, the IKE version(s) chosen should be consistent not only in this element, but with other choices for other elements in this component. While it is acceptable for this capability to be configurable, the default configuration in the evaluated configuration (either "out of the box" or by configuration guidance in the AGD documentation) must enable this functionality.

**FCS\_IPSEC\_EXT.1.13** The TSF shall ensure that all IKE protocols perform peer authentication using [selection: *RSA*, *ECDSA*] that use X.509v3 certificates that conform to RFC 4945 and [selection: *Pre-shared Keys, no other method*].

FCS\_IPSEC\_EXT.1.14 The TSF shall only establish a trusted channel if the presented identifier in the received certificate matches the configured reference identifier, where the presented and reference identifiers are of the following fields and types: [selection: SAN: IP address, SAN: Fully Qualified Domain Name (FQDN), SAN: user FQDN, CN: IP address, CN: Fully Qualified Domain Name (FQDN), CN: user FQDN, Distinguished Name (DN)] and [selection: no other reference identifier type, [assignment: other supported reference identifier types]].

#### C.2.2.5FCS\_NTP\_EXT.1 NTP Protocol

#### **Family Behaviour**

The component in this family addresses the ability for a TOE to protect NTP time synchronization traffic.

#### **Component levelling**

FCS NTP EXT.1 Requires NTP to be implemented as specified

#### **Management: FCS NTP EXT.1**

The following actions could be considered for the management functions in FMT:

a) Ability to configure NTP

#### **Audit: FCS NTP EXT.1**

The following actions should be considered for audit if FAU\_GEN Security audit data generation is included in the PP/ST:

a) No audit requirements are specified.

#### FCS NTP EXT.1 NTP Protocol

Hierarchical to: No other components

Dependencies: FCS COP.1 Cryptographic operation

[FCS DTLSC EXT.1 DTLC Client Protocol or

FCS IPSEC EXT.1 IPsec Protocol]

**FCS\_NTP\_EXT.1.1** The TSF shall use only the following NTP version(s) [selection: *NTP v3* (*RFC 1305*), *NTP v4* (*RFC 5905*)].

FCS NTP EXT.1.2 The TSF shall update its system time using [selection:

- Authentication using [selection: <u>SHA1, SHA256, SHA384, SHA512, AES-CBC-128, AES-CBC-256</u>] as the message digest algorithm(s);
- [selection: <u>IPsec, DTLS</u>] to provide trusted communication between itself and an NTP time source.

1.

FCS\_NTP\_EXT.1.3 The TSF shall not update NTP timestamp from broadcast and/or multicast addresses.

#### **Application Note 176**

The broadcast and multicast addresses are deemed as any addressing scheme designed to be one-to-many.

FCS\_NTP\_EXT.1.4 The TSF shall support configuration of at least three (3) NTP time sources.

#### Application Note 177

The TOE has to support configuration of at least three (3) time sources though not mandated that the TOE is configured to always use at least 3 time sources.

#### C.2.2.6 FCS SSHC EXT.1 SSH Client

#### **Family Behaviour**

The component in this family addresses the ability for a client to use SSH to protect data between the client and a server using the SSH protocol.

#### **Component levelling**

FCS\_SSHC\_EXT.1 SSH Client requires that the client side of SSH be implemented as specified.

#### Management: FCS SSHC EXT.1

The following actions could be considered for the management functions in FMT:

a) There are no management activities foreseen.

#### **Audit: FCS SSHC EXT.1**

The following actions should be considered for audit if FAU\_GEN Security audit data generation is included in the PP/ST:

- a) Failure of SSH session establishment
- b) SSH session establishment
- c) SSH session termination

#### FCS SSHC EXT.1 SSH Client Protocol

Hierarchical to: No other components

Dependencies: FCS CKM.1Cryptographic Key Generation

FCS CKM.2 Cryptographic Key Establishment

FCS\_COP.1/DataEncryption Cryptographic operation (AES

Data encryption/decryption)

FCS COP.1/SigGen Cryptographic operation (Signature

Generation and Verification)

FCS\_COP.1/Hash Cryptographic operation (Hash Algorithm) FCS\_COP.1/KeyedHash Cryptographic operation (Keyed Hash

Algorithm)

FCS RBG EXT.1 Random Bit Generation

FCS\_SSHC\_EXT.1.1 The TSF shall implement the SSH protocol that complies with RFC(s) [selection: 4251, 4252, 4253, 4254, 5647, 5656, 6187, 6668, 8332].

#### **Application Note 178**

The ST author selects which of the RFCs to which conformance is being claimed. Note that these need to be consistent with selections in later elements of this component (e.g., cryptographic algorithms permitted). RFC 4253 indicates that certain cryptographic algorithms are "REQUIRED". This means that the implementation must include support, not that the algorithms must be enabled for use. Ensuring that algorithms indicated as "REQUIRED" but not listed in the later elements of this component are implemented is out of scope of the evaluation activity for this requirement.

RFC 5647 only applies to the RFC compliant implementation of GCM; a TOE that only implements the "@openssh.com" variant of GCM should not select 5647. aes\*-gcm@openssh.com is specified in Section 1.6 of the OpenSSH Protocol Specification (https://cvsweb.openbsd.org/cgi-bin/cvsweb/src/usr.bin/ssh/PROTOCOL?rev=1.31).

**FCS\_SSHC\_EXT.1.2** The TSF shall ensure that the SSH protocol implementation supports the following authentication methods as described in RFC 4252: public key-based, [selection: password-based, no other method].

**FCS\_SSHC\_EXT.1.3** The TSF shall ensure that, as described in RFC 4253, packets greater than [assignment: *number of bytes*] bytes in an SSH transport connection are dropped.

#### **Application Note 179**

RFC 4253 provides for the acceptance of "large packets" with the caveat that the packets should be of "reasonable length" or dropped. The assignment should be filled in by the ST author with the maximum packet size accepted, thus defining "reasonable length" for the TOE.

**FCS\_SSHC\_EXT.1.4** The TSF shall ensure that the SSH transport implementation uses the following encryption algorithms and rejects all other encryption algorithms: [assignment: *list of encryption algorithms*].

FCS\_SSHC\_EXT.1.5 The TSF shall ensure that the SSH public-key based authentication implementation uses [selection: ssh-rsa, <u>rsa-sha2-256, rsa-sha2-512</u>, ecdsa-sha2-nistp256, x509v3-ssh-rsa, ecdsa-sha2-nistp384, ecdsa-sha2-nistp521, x509v3-ecdsa-sha2-nistp256,

x509v3-ecdsa-sha2-nistp384, x509v3-ecdsa-sha2-nistp521, x509v3-rsa2048-sha256] as its public key algorithm(s) and rejects all other public key algorithms

**FCS\_SSHC\_EXT.1.6** The TSF shall ensure that the SSH transport implementation uses [assignment: *list of data integrity MAC algorithms*] as its data integrity MAC algorithm(s) and rejects all other MAC algorithm(s).

**FCS\_SSHC\_EXT.1.7** The TSF shall ensure that [assignment: *list of key exchange methods*] are the only allowed key exchange methods used for the SSH protocol.

**FCS\_SSHC\_EXT.1.8** The TSF shall ensure that within SSH connections the same session keys are used for a threshold of no longer than one hour, and no more than one gigabyte of transmitted data. After either of the thresholds are reached a rekey needs to be performed.

#### Application Note 180

This SFR defines two thresholds - one for the maximum time span the same session keys can be used and the other one for the maximum amount of data that can be transmitted using the same session keys. Both thresholds need to be implemented and a rekey needs to be performed on whichever threshold is reached first. For the maximum transmitted data threshold, the total incoming and outgoing data needs to be counted. The rekey applies to all session keys (encryption, integrity protection) for incoming and outgoing traffic.

It is acceptable for a TOE to implement lower thresholds than the maximum values defined in the SFR.

For any configurable threshold related to this requirement the guidance documentation needs to specify how the threshold can be configured. The allowed values must either be specified in the guidance documentation and must be lower or equal to the thresholds specified in this SFR or the TOE must not accept values beyond the thresholds specified in this SFR.

**FCS\_SSHC\_EXT.1.9** The TSF shall ensure that the SSH client authenticates the identity of the SSH server using a local database associating each host name with its corresponding public key or [selection: *a list of trusted certification authorities, no other methods*] as described in RFC 4251 section 4.1.

#### **Application Note 181**

The list of trusted certification authorities can only be selected if x509v3-ssh-rsa, x509v3-ecdsa-sha2-nistp256, x509v3-ecdsa-sha2-nistp384, x509v3-ecdsa-sha2-nistp521 or x509v3-rsa2048-sha256 are selected in FCS SSHC EXT.1.5.

#### C.2.2.7 FCS\_SSHS\_EXT.1 SSH Server Protocol

#### **Family Behaviour**

The component in this family addresses the ability for a server to offer SSH to protect data between a client and the server using the SSH protocol.

#### **Component levelling**

FCS\_SSHS\_EXT.1 SSH Server requires that the server side of SSH be implemented as specified.

Management: FCS SSHS EXT.1

The following actions could be considered for the management functions in FMT:

a) There are no management activities foreseen.

**Audit: FCS SSHS EXT.1** 

The following actions should be considered for audit if FAU\_GEN Security audit data generation is included in the PP/ST:

- a) Failure of SSH session establishment
- b) SSH session establishment
- c) SSH session termination

#### FCS\_SSHS\_EXT.1 SSH Server Protocol

Hierarchical to: No other components

Dependencies: FCS CKM.1Cryptographic Key Generation

FCS CKM.2 Cryptographic Key Establishment

FCS\_COP.1/DataEncryption Cryptographic operation (AES

Data encryption/decryption)

FCS COP.1/SigGen Cryptographic operation (Signature

Generation and Verification)

FCS\_COP.1/Hash Cryptographic operation (Hash Algorithm) FCS COP.1/KeyedHash Cryptographic operation (Keyed Hash

Algorithm)

FCS RBG EXT.1 Random Bit Generation

**FCS\_SSHS\_EXT.1.1** The TSF shall implement the SSH protocol that complies with RFC(s) [selection: 4251, 4252, 4253, 4254, 5647, 5656, 6187, 6668, 8332].

#### **Application Note 182**

The ST author selects which of the RFCs to which conformance is being claimed. Note that these need to be consistent with selections in later elements of this component (e.g., cryptographic algorithms permitted). RFC 4253 indicates that certain cryptographic algorithms are "REQUIRED". This means that the implementation must include support, not that the algorithms must be enabled for use. Ensuring that algorithms indicated as "REQUIRED" but not listed in the later elements of this component are implemented is out of scope of the evaluation activity for this requirement.

RFC 5647 only applies to the RFC compliant implementation of GCM; a TOE that only implements the "@openssh.com" variant of GCM should not select 5647. aes\*-gcm@openssh.com is specified in Section 1.6 of the OpenSSH Protocol Specification (https://cvsweb.openbsd.org/cgi-bin/cvsweb/src/usr.bin/ssh/PROTOCOL?rev=1.31).

FCS\_SSHS\_EXT.1.2 The TSF shall ensure that the SSH protocol implementation supports the following authentication methods as described in RFC 4252: public key-based, password-based.

**FCS\_SSHS\_EXT.1.3** The TSF shall ensure that, as described in RFC 4253, packets greater than [assignment: *number of bytes*] bytes in an SSH transport connection are dropped.

#### **Application Note 183**

RFC 4253 provides for the acceptance of "large packets" with the caveat that the packets should be of "reasonable length" or dropped. The assignment should be filled in by the ST author with the maximum packet size accepted, thus defining "reasonable length" for the TOE.

**FCS\_SSHS\_EXT.1.4** The TSF shall ensure that the SSH transport implementation uses the following encryption algorithms and rejects all other encryption algorithms: [assignment: *encryption algorithms*].

FCS\_SSHS\_EXT.1.5 The TSF shall ensure that the SSH public-key based authentication implementation uses [selection: ssh-rsa, <u>rsa-sha2-256, rsa-sha2-512</u>, ecdsa-sha2-nistp256, x509v3-ssh-rsa, ecdsa-sha2-nistp384, ecdsa-sha2-nistp521, x509v3-ecdsa-sha2-nistp256, x509v3-ecdsa-sha2-nistp384, x509v3-ecdsa-sha2-nistp521, x509v3-rsa2048-sha256] as its public key algorithm(s) and rejects all other public key algorithms.

**FCS\_SSHS\_EXT.1.6** The TSF shall ensure that the SSH transport implementation uses [assignment: *list of MAC algorithms*] as its MAC algorithm(s) and rejects all other MAC algorithm(s).

FCS\_SSHS\_EXT.1.7 The TSF shall ensure that [assignment: *list of key exchange methods*] are the only allowed key exchange methods used for the SSH protocol.

**FCS\_SSHS\_EXT.1.8** The TSF shall ensure that within SSH connections the same session keys are used for a threshold of no longer than one hour, and no more than one gigabyte of transmitted data. After either of the thresholds are reached a rekey needs to be performed.

#### **Application Note 184**

This SFR defines two thresholds - one for the maximum time span the same session keys can be used and the other one for the maximum amount of data that can be transmitted using the same session keys. Both thresholds need to be implemented and a rekey needs to be performed on whichever threshold is reached first. For the maximum transmitted data threshold, the total incoming and outgoing data needs to be counted. The rekey applies to all session keys (encryption, integrity protection) for incoming and outgoing traffic.

It is acceptable for a TOE to implement lower thresholds than the maximum values defined in the SFR.

For any configurable threshold related to this requirement the guidance documentation needs to specify how the threshold can be configured. The allowed values must either be specified in

the guidance documentation and must be lower or equal to the thresholds specified in this SFR or the TOE must not accept values beyond the thresholds specified in this SFR.

#### C.2.2.8 FCS TLSC EXT TLS Client Protocol

#### **Family Behaviour**

The component in this family addresses the ability for a client to use TLS to protect data between the client and a server using the TLS protocol.

#### **Component levelling**

FCS\_TLSC\_EXT.1 TLS Client requires that the client side of TLS be implemented as specified.

FCS\_TLSC\_EXT.2 TLS Client requires that the client side of the TLS implementation include mutual authentication.

#### Management: FCS TLSC EXT.1, FCS TLSC EXT.2

The following actions could be considered for the management functions in FMT:

a) There are no management activities foreseen.

#### Audit: FCS\_TLSC\_EXT.1, FCS\_TLSC\_EXT.2

The following actions should be considered for audit if FAU\_GEN Security audit data generation is included in the PP/ST:

- a) Failure of TLS session establishment
- b) TLS session establishment
- c) TLS session termination

FCS TLSC EXT.1

# Hierarchical to: No other components FCS\_CKM. 1 Cryptographic Key Generation FCS\_CKM.2 Cryptographic Key Establishment FCS\_COP.1/DataEncryption Cryptographic operation (AES Data encryption/decryption) FCS\_COP.1/SigGen Cryptographic operation (Signature Generation and Verification) FCS\_COP.1/Hash Cryptographic operation (Hash Algorithm) FCS\_COP.1/KeyedHash Cryptographic operation (Keyed Hash

Algorithm)

**TLS Client Protocol** 

#### FCS RBG EXT.1 Random Bit Generation

**FCS\_TLSC\_EXT.1.1** The TSF shall implement [selection: *TLS 1.2 (RFC 5246), TLS 1.1 (RFC 4346)*] and reject all other TLS and SSL versions. The TLS implementation will support the following ciphersuites:

• [assignment: list of optional ciphersuites and reference to RFC in which each is defined].

#### **Application Note 185**

The ciphersuites to be tested in the evaluated configuration are limited by this requirement.

FCS\_TLSC\_EXT.1.2 The TSF shall verify that the presented identifier matches the reference identifier per RFC 6125 section 6.

#### Application Note 186

The rules for verification of identify are described in Section 6 of RFC 6125. The reference identifier is established by the user (e.g. entering a URL into a web browser or clicking a link), by configuration (e.g. configuring the name of a mail server or authentication server), or by an application (e.g. a parameter of an API) depending on the application service. Based on a singular reference identifier's source domain and application service type (e.g. HTTP, SIP, LDAP), the client establishes all reference identifiers which are acceptable, such as a Common Name for the Subject Name field of the certificate and a (case-insensitive) DNS name, URI name, and Service Name for the Subject Alternative Name field. The client then compares this list of all acceptable reference identifiers to the presented identifiers in the TLS server's certificate.

The preferred method for verification is the Subject Alternative Name using DNS names, URI names, or Service Names. Verification using the Common Name is required for the purposes of backwards compatibility. Additionally, support for use of IP addresses in the Subject Name or Subject Alternative name is discouraged as against best practices but may be implemented. Finally, the client should avoid constructing reference identifiers using wildcards. However, if the presented identifiers include wildcards, the client must follow the best practices regarding matching; these best practices are captured in the evaluation activity.

FCS\_TLSC\_EXT.1.3 When establishing a trusted channel, by default the TSF shall not establish a trusted channel if the server certificate is invalid. The TSF shall also [selection:

- Not implement any administrator override mechanism
- require administrator authorization to establish the connection if the TSF fails to [selection: match the reference identifier, validate certificate path, validate expiration date, determine the revocation status] of the presented server certificate

].

#### Application Note 187

"Revocation status" refers to a OCSP or CRL response that indicates the presented certificate is invalid. Inability to make a connection to determine validity shall be handled as specified in FIA X509 EXT.2.2.

If TLS is selected in FTP\_ITC then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/Rev.

If TLS is selected in FPT\_ITT, then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/ITT.

FCS\_TLSC\_EXT.1.4 The TSF shall [selection: not present the Supported Elliptic Curves Extension, present the Supported Elliptic Curves Extension with the following NIST curves: [selection: secp256r1, secp384r1, secp521r1] and no other curves] in the Client Hello.

#### **Application Note 188**

If ciphersuites with elliptic curves were selected in FCS\_TLSC\_EXT.1.1, a selection of one or more curves is required. If no ciphersuites with elliptic curves were selected in FCS\_TLS\_EXT.1.1, then "not present the Supported Elliptic Curves Extension" should be selected.

This requirement limits the elliptic curves allowed for authentication and key agreement to the NIST curves from FCS\_COP.1/SigGen and FCS\_CKM.1 and FCS\_CKM.2. This extension is required for clients supporting Elliptic Curve ciphersuites.

#### FCS\_TLSC\_EXT.2

#### **TLS Client Protocol with Authentication**

Hierarchical to: FCS TLSC EXT.1 TLS Client Protocol

Dependencies: FCS CKM.1Cryptographic Key Generation

FCS CKM.2 Cryptographic Key Establishment

FCS COP.1/DataEncryption Cryptographic operation (AES

Data encryption/decryption)

FCS COP.1/SigGen Cryptographic operation (Signature

Generation and Verification)

FCS\_COP.1/Hash Cryptographic operation (Hash Algorithm) FCS COP.1/KeyedHash Cryptographic operation (Keyed Hash

Algorithm)

FCS RBG EXT.1 Random Bit Generation

**FCS\_TLSC\_EXT.2.1** The TSF shall implement [selection: *TLS 1.2 (RFC 5246), TLS 1.1 (RFC 4346)*] and reject all other TLS and SSL versions. The TLS implementation will support the following ciphersuites:

• [assignment: list of optional ciphersuites and reference to RFC in which each is defined].

#### **Application Note 189**

The ciphersuites to be tested in the evaluated configuration are limited by this requirement.

FCS\_TLSC\_EXT.2.2 The TSF shall verify that the presented identifier matches the reference identifier per RFC 6125 section 6.

#### **Application Note 190**

The rules for verification of identify are described in Section 6 of RFC 6125. The reference identifier is established by the user (e.g. entering a URL into a web browser or clicking a link), by configuration (e.g. configuring the name of a mail server or authentication server), or by an application (e.g. a parameter of an API) depending on the application service. Based on a singular reference identifier's source domain and application service type (e.g. HTTP, SIP, LDAP), the client establishes all reference identifiers which are acceptable, such as a Common Name for the Subject Name field of the certificate and a (case-insensitive) DNS name, URI name, and Service Name for the Subject Alternative Name field. The client then compares this list of all acceptable reference identifiers to the presented identifiers in the TLS server's certificate.

The preferred method for verification is the Subject Alternative Name using DNS names, URI names, or Service Names. Verification using the Common Name is required for the purposes of backwards compatibility. Additionally, support for use of IP addresses in the Subject Name or Subject Alternative name is discouraged as against best practices but may be implemented. Finally, the client should avoid constructing reference identifiers using wildcards. However, if the presented identifiers include wildcards, the client must follow the best practices regarding matching; these best practices are captured in the evaluation activity.

FCS\_TLSC\_EXT.2.3 When establishing a trusted channel, by default the TSF shall not establish a trusted channel if the server certificate is invalid. The TSF shall also [selection:

- Not implement any administrator override mechanism
- require administrator authorization to establish the connection if the TSF fails to [selection: match the reference identifier, validate certificate path, validate expiration date, determine the revocation status] of the presented server certificate

].

#### Application Note 191

"Revocation status" refers to a OCSP or CRL response that indicates the presented certificate is invalid. Inability to make a connection to determine validity shall be handled as specified in FIA X509 EXT.2.2.

If TLS is selected in FTP\_ITC then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/Rev.

If TLS is selected in FPT\_ITT, then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/ITT.

**FCS\_TLSC\_EXT.2.4** The TSF shall [selection: not present the Supported Elliptic Curves Extension, present the Supported Elliptic Curves Extension with the following NIST curves: [selection: secp256r1, secp384r1, secp521r1] and no other curves] in the Client Hello.

#### Application Note 192

If ciphersuites with elliptic curves were selected in FCS\_TLSC\_EXT.1.1, a selection of one or more curves is required. If no ciphersuites with elliptic curves were selected in

FCS\_TLS\_EXT.1.1, then "not present the Supported Elliptic Curves Extension" should be selected.

This requirement limits the elliptic curves allowed for authentication and key agreement to the NIST curves from FCS\_COP.1/SigGen and FCS\_CKM.1 and FCS\_CKM.2. This extension is required for clients supporting Elliptic Curve ciphersuites.

FCS\_TLSC\_EXT.2.5 The TSF shall support mutual authentication using X.509v3 certificates.

#### Application Note 193

The use of X.509v3 certificates for TLS is addressed in FIA\_X509\_EXT.2.1. This requirement adds that this use must include the client must be capable of presenting a certificate to a TLS server for TLS mutual authentication.

#### C.2.2.9 FCS TLSS EXT TLS Server Protocol

#### **Family Behaviour**

The component in this family addresses the ability for a server to use TLS to protect data between a client and the server using the TLS protocol.

#### **Component levelling**

FCS\_TLSS\_EXT.1 TLS Server requires that the server side of TLS be implemented as specified.

FCS\_TLSS\_EXT.2: TLS Server requires the mutual authentication be included in the TLS implementation.

#### Management: FCS TLSS EXT.1, FCS TLSS EXT.2

The following actions could be considered for the management functions in FMT:

a) There are no management activities foreseen.

#### **Audit: FCS TLSS EXT.1, FCS TLSS EXT.2**

The following actions should be considered for audit if FAU\_GEN Security audit data generation is included in the PP/ST:

- a) Failure of TLS session establishment
- b) TLS session establishment
- c) TLS session termination

#### FCS TLSS EXT.1 TLS Server Protocol

Hierarchical to: No other components

Dependencies: FCS CKM.1 Cryptographic Key Generation

FCS CKM.2 Cryptographic Key Establishment

FCS COP.1/DataEncryption Cryptographic operation (AES

Data encryption/decryption)

FCS\_COP.1/SigGen Cryptographic operation (Signature

Generation and Verification)

FCS\_COP.1/Hash Cryptographic operation (Hash Algorithm) FCS COP.1/KeyedHash Cryptographic operation (Keyed Hash

Algorithm)

FCS\_RBG\_EXT.1 Random Bit Generation

**FCS\_TLSS\_EXT.1.1** The TSF shall implement [selection: *TLS 1.2 (RFC 5246), TLS 1.1 (RFC 4346)*] and reject all other TLS and SSL versions. The TLS implementation will support the following ciphersuites:

• [assignment: list of optional ciphersuites and reference to RFC in which each is defined].

#### Application Note 194

The ciphersuites to be tested in the evaluated configuration are limited by this requirement.

**FCS\_TLSS\_EXT.1.2** The TSF shall deny connections from clients requesting SSL 2.0, SSL 3.0, TLS 1.0 and [selection: *TLS 1.1, TLS 1.2, none*].

#### **Application Note 195**

All SSL versions and TLS v1.0 are denied. Any TLS versions not selected in FCS\_TLSS\_EXT.1.1 should be selected here. (If "none" is the selection for this element then the ST author may omit the words "and none".)

**FCS\_TLSS\_EXT.1.3** The TSF shall [selection: perform RSA key establishment with key size [selection: 2048 bits, 3072 bits, 4096 bits]; generate EC Diffie-Hellman parameters over NIST curves [selection: secp256r1, secp384r1, secp521r1] and no other curves; generate Diffie-Hellman parameters of size [selection: 2048 bits, 3072 bits]].

#### **Application Note 196**

The assignments will be filled in based on the assignments performed in FCS TLSS EXT.1.1.

FCS_TLSS_EXT.2	TLS Server Protocol with mutual authentication
Hierarchical to:	FCS_TLSS_EXT.1 TLS Server Protocol
Dependencies:	FCS_CKM.1 Cryptographic Key Generation FCS_CKM.2 Cryptographic Key Establishment

FCS\_COP.1/DataEncryption Cryptographic operation (AES Data encryption/decryption)

FCS\_COP.1/SigGen Cryptographic operation (Signature Generation and Verification)

FCS\_COP.1/Hash Cryptographic operation (Hash Algorithm)

FCS\_COP.1/KeyedHash Cryptographic operation (Keyed Hash Algorithm)

FCS RBG EXT.1 Random Bit Generation

**FCS\_TLSS\_EXT.2.1** The TSF shall implement [selection: *TLS 1.2 (RFC 5246), TLS 1.1 (RFC 4346)*] and reject all other TLS and SSL versions. The TLS implementation will support the following ciphersuites:

• [assignment: list of optional ciphersuites and reference to RFC in which each is defined].

#### Application Note 197

The ciphersuites to be tested in the evaluated configuration are limited by this requirement.

**FCS\_TLSS\_EXT.2.2** The TSF shall deny connections from clients requesting SSL 2.0, SSL 3.0, TLS 1.0 and [selection: *TLS 1.1, TLS 1.2, none*].

#### Application Note 198

All SSL versions and TLS v1.0 are denied. Any TLS versions not selected in FCS\_TLSS\_EXT.1.1 should be selected here. (If "none" is the selection for this element then the ST author may omit the words "and none".)

**FCS\_TLSS\_EXT.2.3** The TSF shall [selection: perform RSA key establishment with key size [selection: 2048 bits, 3072 bits, 4096 bits]; generate EC Diffie-Hellman parameters over NIST curves [selection: secp256r1, secp384r1, secp521r1] and no other curves; generate Diffie-Hellman parameters of size [selection: 2048 bits, 3072 bits]].

#### Application Note 199

The assignments will be filled in based on the assignments performed in FCS TLSS EXT.2.1.

FCS\_TLSS\_EXT.2.4 The TSF shall support mutual authentication of TLS clients using X.509v3 certificates.

#### Application Note 200

The use of X.509v3 certificates for TLS is addressed in FIA\_X509\_EXT.2.1. This requirement adds that this use must include support for client-side certificates for TLS mutual authentication.

FCS\_TLSS\_EXT.2.5 When establishing a trusted channel, by default the TSF shall not establish a trusted channel if the client certificate is invalid. The TSF shall also [selection:

• Not implement any administrator override mechanism

• require administrator authorization to establish the connection if the TSF fails to [selection: match the reference identifier, validate certificate path, validate expiration date, determine the revocation status] of the presented client certificate

].

#### Application Note 201

"Revocation status" refers to a OCSP or CRL response that indicates the presented certificate is invalid. Inability to make a connection to determine validity shall be handled as specified in FIA X509 EXT.2.2.

If TLS is selected in FTP\_ITC then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/Rev.

If TLS is selected in FPT\_ITT, then certificate validity is tested in accordance with testing performed for FIA X509 EXT.1/ITT.

FCS\_TLSS\_EXT.2.6 The TSF shall not establish a trusted channel if the distinguished name (DN) or Subject Alternative Name (SAN) contained in a certificate does not match the expected identifier for the client.

#### **Application Note 202**

This requirement only applies to those TOEs performing mutually-authenticated TLS (FCS\_TLSS\_EXT.2.4). The peer identifier may be in the Subject field or the Subject Alternative Name extension of the certificate. The expected identifier may either be configured, may be compared to the Domain Name, IP address, username, or email address used by the peer, or may be passed to a directory server for comparison.

#### C.3 Identification and Authentication (FIA)

#### C.3.1 Password Management (FIA PMG EXT)

#### **Family Behaviour**

The TOE defines the attributes of passwords used by administrative users to ensure that strong passwords and passphrases can be chosen and maintained.

#### **Component levelling**

FIA\_PMG\_EXT.1 Password management requires the TSF to support passwords with varying composition requirements, minimum lengths, maximum lifetime, and similarity constraints.

Management: FIA PMG EXT.1

No management functions.

**Audit: FIA PMG EXT.1** 

No specific audit requirements.

#### C.3.1.1 FIA PMG EXT.1 Password Management

#### FIA PMG EXT.1 Password Management

Hierarchical to: No other components.

Dependencies: No other components.

**FIA\_PMG\_EXT.1.1** The TSF shall provide the following password management capabilities for administrative passwords:

- a) Passwords shall be able to be composed of any combination of upper and lower case letters, numbers, and the following special characters: [selection: "!", "@", "#", "\$", "%", "%", "&", "\*", "(", ")", [assignment: other characters]];
- b) Minimum password length shall be configurable to between [assignment: minimum number of characters supported by the TOE] and [assignment: number of characters greater than or equal to 15] characters.

#### **Application Note 203**

The ST author selects the special characters that are supported by the TOE. They may optionally list additional special characters supported using the assignment. "Administrative passwords" refers to passwords used by Administrators at the local console, over protocols that support passwords, such as SSH and HTTPS, or to grant configuration data that supports other SFRs in the Security Target.

The second assignment should be configured with the largest minimum password length the Security Administrator can configure.

#### C.3.2 User Identification and Authentication (FIA UIA EXT)

#### **Family Behaviour**

The TSF allows certain specified actions before the non-TOE entity goes through the identification and authentication process.

#### **Component levelling**

FIA\_UIA\_EXT.1 User Identification and Authentication requires Administrators (including remote Administrators) to be identified and authenticated by the TOE, providing assurance for that end of the communication path. It also ensures that every user is identified and authenticated before the TOE performs any mediated functions

#### Management: FIA UIA EXT.1

The following actions could be considered for the management functions in FMT:

a) Ability to configure the list of TOE services available before an entity is identified and authenticated

#### Audit: FIA\_UIA\_EXT.N

The following actions should be auditable if FAU\_GEN Security audit data generation is included in the PP/ST:

- a) All use of the identification and authentication mechanism
- b) Provided user identity, origin of the attempt (e.g. IP address)

#### C.3.2.1 FIA\_UIA\_EXT.1 User Identification and Authentication

#### FIA UIA EXT.1 User Identification and Authentication

Hierarchical to: No other components.

Dependencies: FTA TAB.1 Default TOE Access Banners

**FIA\_UIA\_EXT.1.1** The TSF shall allow the following actions prior to requiring the non-TOE entity to initiate the identification and authentication process:

- Display the warning banner in accordance with FTA\_TAB.1;
- [selection: no other actions, automated generation of cryptographic keys, [assignment: list of services, actions performed by the TSF in response to non-TOE requests].

**FIA\_UIA\_EXT.1.2** The TSF shall require each administrative user to be successfully identified and authenticated before allowing any other TSF-mediated actions on behalf of that administrative user.

#### **Application Note 204**

This requirement applies to users (Administrators and external IT entities) of services available from the TOE directly, and not services available by connecting through the TOE. While it should be the case that few or no services are available to external entities prior to identification and authentication, if there are some available (perhaps ICMP echo) these should be listed in the assignment statement; if automated generation of cryptographic keys is supported without administrator authentication, the option "automated generation of cryptographic keys" should be selected; otherwise "no other actions" should be selected.

Authentication can be password-based through the local console or through a protocol that supports passwords (such as SSH), or be certificate based (such as SSH, TLS).

For communications with external IT entities (an audit server, for instance), such connections must be performed in accordance with FTP\_ITC.1, whose protocols perform identification and authentication. This means that such communications (e.g., establishing the IPsec connection to the authentication server) would not have to be specified in the assignment, since establishing the connection "counts" as initiating the identification and authentication process.

According to the application note for FMT\_SMR.2, for distributed TOEs at least one TOE component has to support the authentication of Security Administrators according to FIA\_UIA\_EXT.1 and FIA\_UAU\_EXT.2 but not necessarily all TOE components. In case not all TOE components support this way of authentication for Security Administrators the TSS shall describe how Security Administrators are authenticated and identified.

#### C.3.3 User authentication (FIA UAU EXT)

#### Family Behaviour

Provides for a locally based administrative user authentication mechanism

#### **Component levelling**

FIA\_UAU\_EXT.2 The password-based authentication mechanism provides administrative users a locally based authentication mechanism.

#### Management: FIA UAU EXT.2

The following actions could be considered for the management functions in FMT:

a) None

#### **Audit: FIA UAU EXT.2**

The following actions should be auditable if FAU\_GEN Security audit data generation is included in the PP/ST:

a) Minimal: All use of the authentication mechanism

#### C.3.3.1 FIA UAU EXT.2 Password-based Authentication Mechanism

### FIA\_UAU\_EXT.2 Password-based Authentication Mechanism

Hierarchical to: No other components.

Dependencies: No other components.

**FIA\_UAU\_EXT.2.1** The TSF shall provide a local password-based authentication mechanism, [selection: [assignment: other authentication mechanism(s)], no other authentication mechanism] to perform local administrative user authentication.

#### **Application Note 205**

The assignment should be used to identify any additional local authentication mechanisms supported. Local authentication mechanisms are defined as those that occur through the local

console; remote administrative sessions (and their associated authentication mechanisms) are specified in FTP TRP.1/Admin.

According to the application note for FMT\_SMR.2, for distributed TOEs at least one TOE component has to support the authentication of Security Administrators according to FIA\_UIA\_EXT.1 and FIA\_UAU\_EXT.2 but not necessarily all TOE components. In case not all TOE components support this way of authentication for Security Administrators the TSS shall describe how Security Administrators are authenticated and identified.

#### C.3.4 Authentication using X.509 certificates (FIA\_X509\_EXT)

#### **Family Behaviour**

This family defines the behaviour, management, and use of X.509 certificates for functions to be performed by the TSF. Components in this family require validation of certificates according to a specified set of rules, use of certificates for authentication for protocols and integrity verification, and the generation of certificate requests.

#### **Component levelling**

FIA\_X509\_EXT.1 X509 Certificate Validation, requires the TSF to check and validate certificates in accordance with the RFCs and rules specified in the component.

FIA\_X509\_EXT.2 X509 Certificate Authentication, requires the TSF to use certificates to authenticate peers in protocols that support certificates, as well as for integrity verification and potentially other functions that require certificates.

FIA\_X509\_EXT.3 X509 Certificate Requests, requires the TSF to be able to generate Certificate Request Messages and validate responses.

#### Management: FIA X509 EXT.1, FIA X509 EXT.2, FIA X509 EXT.3

The following actions could be considered for the management functions in FMT:

- a) Remove imported X.509v3 certificates
- b) Approve import and removal of X.509v3 certificates
- c) Initiate certificate requests

#### Audit: FIA X509 EXT.1, FIA X509 EXT.2, FIA X509 EXT.3

The following actions should be auditable if FAU\_GEN Security audit data generation is included in the PP/ST:

a) Minimal: No specific audit requirements are specified.

#### C.3.4.1 FIA X509 EXT.1 X.509 Certificate Validation

#### FIA X509 EXT.1 X.509 Certificate Validation

Hierarchical to: No other components

Dependencies: FIA X509 EXT.2 X.509 Certificate Authentication

**FIA\_X509\_EXT.1.1** The TSF shall validate certificates in accordance with the following rules:

- RFC 5280 certificate validation and certification path validation.
- The certification path must terminate with a trusted CA certificate designated as a trust anchor.
- The TSF shall validate a certification path by ensuring that all CA certificates in the certification path contain the basicConstraints extension with the CA flag set to TRUE.
- The TSF shall validate the revocation status of the certificate using [selection: the Online Certificate Status Protocol (OCSP) as specified in RFC 6960, a Certificate Revocation List (CRL) as specified in RFC 5280 Section 6.3, Certificate Revocation List (CRL) as specified in RFC 5759 Section 5, no revocation method]
- The TSF shall validate the extendedKeyUsage field according to the following rules: [assignment: rules that govern contents of the extendedKeyUsage field that need to be verified].

#### **Application Note 206**

FIA\_X509\_EXT.1.1 lists the rules for validating certificates. The ST author selects whether revocation status is verified using OCSP or CRLs. If the TOE is distributed and X.509 based authentication is being used to authenticate the protocol selected in FPT\_ITT.1, certificate revocation checking is optional. It is optional because there are additional requirements surrounding the enabling and disabling of the FPT\_ITT channel defined in FCO\_CPC\_EXT.1. If revocation is not supported the ST author selects no revocation method. The ST author fills in the assignment with rules that may apply to other requirements in the ST. For instance, if a protocol such as TLS that uses certificates is specified in the ST, then certain values for the extendedKeyUsage field (e.g., "Server Authentication Purpose") could be specified.

**FIA\_X509\_EXT.1.2** The TSF shall only treat a certificate as a CA certificate if the basicConstraints extension is present and the CA flag is set to TRUE.

#### **Application Note 207**

This requirement applies to certificates that are used and processed by the TSF and restricts the certificates that may be added as trusted CA certificates.

#### C.3.4.2 FIA X509 EXT.2 X509 Certificate Authentication

#### FIA X509 EXT.2 X.509 Certificate Authentication

Hierarchical to: No other components

Dependencies: FIA X509 EXT.1 X.509 Certificate Validation

**FIA\_X509\_EXT.2.1** The TSF shall use X.509v3 certificates as defined by RFC 5280 to support authentication for [selection: *DTLS, HTTPS, IPsec, TLS, SSH, [assignment: other protocols], no protocols*], and [selection: *code signing for system software updates, code signing for integrity verification, [assignment: other uses], no additional uses*].

#### **Application Note 208**

If the TOE specifies the implementation of communications protocols that perform peer authentication using certificates, the ST author either selects or assigns the protocols that are specified; otherwise, they select "no protocols". Protocols that do not use X.509 based peer authentication include SSH, where ssh-rsa, ecdsa-sha2-nistp256, ecdsa-sha2-nistp384, and/or ecdsa-sha2-nistp521 are selected. The TOE may also use certificates for other purposes; the second selection and assignment are used to specify these cases.

**FIA\_X509\_EXT.2.2** When the TSF cannot establish a connection to determine the validity of a certificate, the TSF shall [selection: *allow the Administrator to choose whether to accept the certificate in these cases, accept the certificate, not accept the certificate*].

#### **Application Note 209**

Often a connection must be established to check the revocation status of a certificate - either to download a CRL or to perform a lookup using OCSP. The selection is used to describe the behaviour in the event that such a connection cannot be established (for example, due to a network error). If the TOE has determined the certificate valid according to all other rules in FIA\_X509\_EXT.1, the behaviour indicated in the selection determines the validity. The TOE must not accept the certificate if it fails any of the other validation rules in FIA\_X509\_EXT.1. If the Administrator-configured option is selected by the ST Author, the ST Author also selects the corresponding function in FMT\_SMF.1.

If the TOE is distributed and FIA\_X509\_EXT.1/ITT is selected, then certificate revocation checking is optional. This is due to additional authorization actions being performed in the enabling and disabling of the intra-TOE trusted channel as defined in FCO\_CPC\_EXT.1. In this case, a connection is not required to determine certificate validity and this SFR is trivially satisfied.

#### C.3.4.3 FIA X509 EXT.3 X.509 Certificate Requests

#### FIA X509 EXT.3 X.509 Certificate Requests

Hierarchical to: No other components

Dependencies: FCS CKM.1 Cryptographic Key Generation

FIA X509 EXT.1 X.509 Certificate Validation

**FIA\_X509\_EXT.3.1** The TSF shall generate a Certificate Request as specified by RFC 2986 and be able to provide the following information in the request: public key and [selection: device-specific information, Common Name, Organization, Organizational Unit, Country, [assignment: other information]].

**FIA\_X509\_EXT.3.2** The TSF shall validate the chain of certificates from the Root CA upon receiving the CA Certificate Response.

#### C.4 Protection of the TSF (FPT)

#### C.4.1 Protection of TSF Data (FPT\_SKP\_EXT)

#### **Family Behaviour**

Components in this family address the requirements for managing and protecting TSF data, such as cryptographic keys. This is a new family modelled after the FPT PTD Class.

#### **Component levelling**

FPT\_SKP\_EXT.1 Protection of TSF Data (for reading all symmetric keys), requires preventing symmetric keys from being read by any user or subject. It is the only component of this family.

#### **Management: FPT SKP EXT.1**

The following actions could be considered for the management functions in FMT:

a) There are no management activities foreseen.

#### **Audit: FPT SKP EXT.1**

The following actions should be auditable if FAU\_GEN Security audit data generation is included in the PP/ST:

a) There are no auditable events foreseen.

#### C.4.1.1 FPT\_SKP\_EXT.1 Protection of TSF Data (for reading of all symmetric keys)

FPT_SKP_EXT.1	Protection of TSF Data (for reading of all symmetric keys)
Hierarchical to:	No other components.
Dependencies:	No other components.

**FPT\_SKP\_EXT.1.1** The TSF shall prevent reading of all pre-shared keys, symmetric keys, and private keys.

#### **Application Note 210**

The intent of this requirement is for the device to protect keys, key material, and authentication credentials from unauthorized disclosure. This data should only be accessed for the purposes of their assigned security functionality, and there is no need for them to be displayed/accessed at any other time. This requirement does not prevent the device from providing indication that these exist, are in use, or are still valid. It does, however, restrict the reading of the values outright.

#### **C.4.2** Protection of Administrator Passwords (FPT\_APW\_EXT)

#### C.4.2.1 FPT APW EXT.1 Protection of Administrator Passwords

#### **Family Behaviour**

Components in this family ensure that the TSF will protect plaintext credential data such as passwords from unauthorized disclosure.

#### **Component levelling**

FPT\_APW\_EXT.1 Protection of Administrator passwords requires that the TSF prevent plaintext credential data from being read by any user or subject.

#### **Management: FPT APW EXT.1**

The following actions could be considered for the management functions in FMT:

a) No management functions.

#### **Audit: FPT APW EXT.1**

The following actions should be auditable if FAU\_GEN Security audit data generation is included in the PP/ST:

a) No audit necessary.

#### FPT\_APW\_EXT.1 Protection of Administrator Passwords

Hierarchical to: No other components

Dependencies: No other components.

**FPT APW EXT.1.1** The TSF shall store passwords in non-plaintext form.

#### **FPT APW EXT.1.2** The TSF shall prevent the reading of plaintext passwords.

#### **Application Note 211**

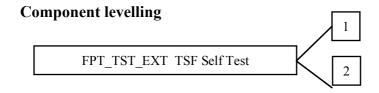

The intent of the requirement is that raw password authentication data is not stored in the clear, and that no user or Administrator is able to read the plaintext password through "normal" interfaces. An all-powerful Administrator could directly read memory to capture a password but is trusted not to do so. Passwords should be obscured during entry on the local console in accordance with FIA UAU.7.

#### C.4.3 TSF Self-Test (FPT TST EXT)

#### C.4.3.1 FPT\_TST\_EXT.1 TSF Testing

#### **Family Behaviour**

Components in this family address the requirements for self-testing the TSF for selected correct operation.

FPT\_TST\_EXT.1 TSF Self-Test requires a suite of self-tests to be run during initial start-up in order to demonstrate correct operation of the TSF.

FPT\_TST\_EXT.2 Self-tests based on certificates applies when using certificates as part of self-test, and requires that the self-test fails if a certificate is invalid.

#### Management: FPT TST EXT.1, FPT TST EXT.2

The following actions could be considered for the management functions in FMT:

a) No management functions.

#### Audit: FPT TST EXT.1, FPT TST EXT.2

The following actions should be considered for audit if FAU\_GEN Security audit data generation is included in the PP/ST:

- a) Indication that TSF self-test was completed
- b) Failure of self-test

FPT_TST_EXT.1	TSF testing
Hierarchical to:	No other components.
Dependencies:	No other components.

**FPT\_TST\_EXT.1.1** The TSF shall run a suite of the following self-tests [selection: during initial start-up (on power on), periodically during normal operation, at the request of the authorised user, at the conditions [assignment: conditions under which self-tests should occur]] to demonstrate the correct operation of the TSF: [assignment: list of self-tests run by the TSF].

#### **Application Note 212**

It is expected that self-tests are carried out during initial start-up (on power on). Other options should only be used if the developer can justify why they are not carried out during initial start-up. It is expected that at least self-tests for verification of the integrity of the firmware and software as well as for the correct operation of cryptographic functions necessary to fulfil the SFRs will be performed. If not all self-tests are performed during start-up multiple iterations of this SFR are used with the appropriate options selected. In future versions of this cPP the suite of self-tests will be required to contain at least mechanisms for measured boot including self-tests of the components which perform the measurement.

Non-distributed TOEs may internally consist of several components that contribute to enforcing SFRs. Self-testing shall cover all components that contribute to enforcing SFRs and verification of integrity shall cover all software that contributes to enforcing SFRs on all components.

For distributed TOEs all TOE components have to perform self-tests. This does not necessarily mean that each TOE component has to carry out the same self-tests: the ST describes the applicability of the selection (i.e. when self-tests are run) and the final assignment (i.e. which self-tests are carried out) to each TOE component.

#### **Application Note 213**

If certificates are used by the self-test mechanism (e.g. for verification of signatures for integrity verification), certificates are validated in accordance with FIA\_X509\_EXT.1 and should be selected in FIA\_X509\_EXT.2.1. Additionally, FPT\_TST\_EXT.2 must be included in the ST.

#### FPT TST EXT.2 Self-tests based on certificates

Hierarchical to: No other components.

Dependencies: No other components.

**FPT\_TST\_EXT.2.1** The TSF shall fail self-testing if a certificate is used for self-tests and the corresponding certificate is deemed invalid.

#### Application Note 214

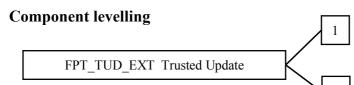

Certificates may optionally be used for self-tests (FPT\_TST\_EXT.1.1). This element must be included in the ST if certificates are used for self-tests. If "code signing for integrity verification" is selected in FIA X509 EXT.2.1, FPT TST EXT.2 must be included in the ST.

Validity is determined by the certification path and the expiration date. If the self-test is executed as part of TOE initialization (e.g. boot), there is no expectation of a revocation status check as the necessary functionality, configuration, or infrastructure required to perform such check might not be available.

#### C.4.4 Trusted Update (FPT TUD EXT)

#### **Family Behaviour**

Components in this family address the requirements for updating the TOE firmware and/or software.

FPT\_TUD\_EXT.1 Trusted Update requires management tools be provided to update the TOE firmware and software, including the ability to verify the updates prior to installation.

FPT\_TUD\_EXT.2 Trusted update based on certificates applies when using certificates as part of trusted update and requires that the update does not install if a certificate is invalid.

#### Management: FPT TUD EXT.1

The following actions could be considered for the management functions in FMT:

- a) Ability to update the TOE and to verify the updates
- b) Ability to update the TOE and to verify the updates using the digital signature capability (FCS\_COP.1/SigGen) and [selection: *no other functions, [assignment: other cryptographic functions (or other functions) used to support the update capability*]
- c) Ability to update the TOE, and to verify the updates using [selection: *digital signature*, *published hash*, *no other mechanism*] capability prior to installing those updates

#### Audit: FPT\_TUD\_EXT.1, FPT\_TUD\_EXT.2

The following actions should be auditable if FAU\_GEN Security audit data generation is included in the PP/ST:

- a) Initiation of the update process.
- b) Any failure to verify the integrity of the update

#### C.4.4.1 FPT TUD EXT.1 Trusted Update

FPT_TUD_EXT.1	Trusted update
Hierarchical to:	No other components

Dependencies: FCS\_COP.1/SigGen Cryptographic operation (for

Cryptographic Signature and Verification), or FCS\_COP.1/Hash Cryptographic operation (for cryptographic

hashing)

**FPT\_TUD\_EXT.1.1** The TSF shall provide [assignment: *Administrators*] the ability to query the currently executing version of the TOE firmware/software and [selection: *the most recently installed version of the TOE firmware/software; no other TOE firmware/software version*].

#### **Application Note 215**

If a trusted update can be installed on the TOE with a delayed activation the version of both the currently executing image and the installed but inactive image must be provided. In this case the option 'the most recently installed version of the TOE firmware/software' needs to be chosen from the selection in FPT\_TUD\_EXT.1.1 and the TSS needs to describe how and when the inactive version becomes active. If all trusted updates become active as part of the installation process, only the currently executing version needs to be provided. In this case the option 'no other TOE firmware/software version' shall be chosen from the selection in FPT\_TUD\_EXT.1.1.

For a distributed TOE, the method of determining the installed versions on each component of the TOE is described in the operational guidance.

**FPT\_TUD\_EXT.1.2** The TSF shall provide [assignment: *Administrators*] the ability to manually initiate updates to TOE firmware/software and [selection: *support automatic checking for updates, support automatic updates, no other update mechanism*].

#### **Application Note 216**

The selection in FPT\_TUD\_EXT.1.2 distinguishes the support of automatic checking for updates and support of automatic updates. The first option refers to a TOE that checks whether a new update is available, communicates this to the Administrator (e.g. through a message during an Administrator session, through log files) but requires some action by the Administrator to actually perform the update. The second option refers to a TOE that checks for updates and automatically installs them upon availability.

The TSS explains what actions are involved in the TOE support when using the "support automatic checking for updates" or "support automatic updates" selections.

When published hash values (see FPT\_TUD\_EXT.1.3) are used to protect the trusted update mechanism, the TOE must not automatically download the update file(s) together with the hash value (either integrated in the update file(s) or separately) and automatically install the update without any active authorization by the Security Administrator, even when the calculated hash value matches the published hash value. When using published hash values to protect the trusted update mechanism, the option "support of automatic updates" must not be used (automated checking for updates is permitted, though). The TOE may automatically download the update file(s) themselves but not to the hash value. For the published hash approach, it is intended that a Security Administrator is always required to give active authorisation for installation of an update (as described in more detail under FPT\_TUD\_EXT.1.3) below. Due to this, the type of update mechanism is regarded as "manually initiated update", even if the update file(s) may be downloaded automatically. A fully automated approach (without Security

Administrator intervention) can only be used when "digital signature mechanism" is selected in FPT TUD EXT.1.3 below.

**FPT\_TUD\_EXT.1.3** The TSF shall provide means to authenticate firmware/software updates to the TOE using a [selection: *digital signature mechanism, published hash*] prior to installing those updates.

#### Application Note 217

The digital signature mechanism referenced in the selection of FPT\_TUD\_EXT.1.3 is one of the algorithms specified in FCS\_COP.1/SigGen. The published hash referenced in FPT\_TUD\_EXT.1.3 is generated by one of the functions specified in FCS\_COP.1/Hash. The ST author should choose the mechanism implemented by the TOE; it is acceptable to implement both mechanisms.

When published hash values are used to secure the trusted update mechanism, an active authorization of the update process by the Security Administrator is always required. The secure transmission of an authentic hash value from the developer to the Security Administrator is one of the key factors to protect the trusted update mechanism when using published hashes and the guidance documentation needs to describe how this transfer has to be performed. For the verification of the trusted hash value by the Security Administrator different use cases are possible. The Security Administrator could obtain the published hash value as well as the update file(s) and perform the verification outside the TOE while the hashing of the update file(s) could be done by the TOE or by other means. Authentication as Security Administrator and initiation of the trusted update would in this case be regarded as "active authorization" of the trusted update. Alternatively, the Administrator could provide the *TOE* with the published hash value together with the update file(s) and the hashing and hash comparison is performed by the TOE. In case of successful hash verification, the TOE can perform the update without any additional step by the Security Administrator. Authentication as Security Administrator and sending the hash value to the TOE is regarded as "active authorization" of the trusted update (in case of successful hash verification), because the Administrator is expected to load the hash value only to the TOE when intending to perform the update. As long as the transfer of the hash value to the TOE is performed by the Security Administrator, loading of the update file(s) can be performed by the Security Administrator or can be automatically downloaded by the TOE from a repository.

If the digital signature mechanism is selected, the verification of the signature shall be performed by the TOE itself. For the published hash option, the verification can be done by the TOE itself as well as by the Security Administrator. In the latter case use of TOE functionality for the verification is not mandated, so verification could be done using non-TOE functionality of the device containing the TOE or without using the device containing the TOE.

For distributed TOEs all TOE components shall support Trusted Update. The verification of the signature or hash on the update shall either be done by each TOE component itself (signature verification) or for each component (hash verification).

Updating a distributed TOE might lead to the situation where different TOE components are running different software versions. Depending on the differences between the different software versions the impact of a mixture of different software versions might be no problem at all or critical to the proper functioning of the TOE. The TSS shall detail the mechanisms that

support the continuous proper functioning of the TOE during trusted update of distributed TOEs.

#### Application Note 218

Future versions of this cPP will mandate the use of a digital signature mechanism for trusted updates.

#### Application Note 219

If certificates are used by the update verification mechanism, certificates are validated in accordance with FIA\_X509\_EXT.1 and should be selected in FIA\_X509\_EXT.2.1. Additionally, FPT\_TUD\_EXT.2 must be included in the ST.

#### **Application Note 220**

"Update" in the context of this SFR refers to the process of replacing a non-volatile, system resident software component with another. The former is referred to as the NV image, and the latter is the update image. While the update image is typically newer than the NV image, this is not a requirement. There are legitimate cases where the system owner may want to rollback a component to an older version (e.g. when the component manufacturer releases a faulty update, or when the system relies on an undocumented feature no longer present in the update). Likewise, the owner may want to update with the same version as the NV image to recover from faulty storage.

All discrete firmware and software elements (e.g. applications, drivers, and kernel) of the TSF need to be protected, i.e. they should either be digitally signed by the corresponding manufacturer and subsequently verified by the mechanism performing the update or a hash should be published for them which needs to be verified before the update.

#### C.4.4.2 FPT TUD EXT.2 Trusted Update based on certificates

#### FPT TUD EXT.2 Trusted update based on certificates

Hierarchical to: No other components

Dependencies: FPT\_TUD\_EXT.1

**FPT\_TUD\_EXT.2.1** The TSF shall not install an update if the code signing certificate is deemed invalid.

**FPT\_TUD\_EXT.2.2** When the certificate is deemed invalid because the certificate has expired, the TSF shall [selection: *allow the Administrator to choose whether to accept the certificate in these cases, accept the certificate, not accept the certificate*].

#### Application Note 221

Certificates may optionally be used for code signing of system software updates (FPT\_TUD\_EXT.1.3). This element must be included in the ST if certificates are used for validating updates. If "code signing for system software updates" is selected in FIA X509 EXT.2.1, FPT TUD EXT.2 must be included in the ST.

Validity is determined by the certification path, the expiration date, and the revocation status in accordance with FIA\_X509\_EXT.1. For expired certificates the author of the ST selects whether the certificate shall be accepted, rejected or the choice is left to the Administrator to accept or reject the certificate.

#### C.4.5 Time stamps (FPT STM EXT)

#### **Family Behaviour**

Components in this family extend FPT\_STM requirements by describing the source of time used in timestamps.

#### **Component levelling**

FPT\_STM\_EXT.1 Reliable Time Stamps is hierarchic to FPT\_STM.1: it requires that the TSF provide reliable time stamps for TSF and identifies the source of the time used in those timestamps.

#### **Management: FPT STM EXT.1**

The following actions could be considered for the management functions in FMT:

- a) Management of the time
- b) Administrator setting of the time.

#### **Audit: FTA SSL EXT.1**

The following actions should be auditable if FAU\_GEN Security audit data generation is included in the PP/ST:

a) Discontinuous changes to the time.

#### C.4.5.1FPT STM EXT.1 Reliable Time Stamps

FPT_STM_EXT.1	Reliable Time Stamps
Hierarchical to:	No other components
Dependencies:	No other components.

**FPT STM EXT.1.1** The TSF shall be able to provide reliable time stamps for its own use.

**FPT\_STM\_EXT.1.2** The TSF shall [selection: *allow the Security Administrator to set the time, synchronise time with an NTP server*].

#### **Application Note 222**

Reliable time stamps are expected to be used with other TSF, e.g. for the generation of audit data to allow the Security Administrator to investigate incidents by checking the order of events and to determine the actual local time when events occurred. The decision about the required level of accuracy of that information is up to the Administrator.

The TOE depends on time and date information, either provided by a local real-time clock that is manually managed by the Security Administrator or through the use of one or more external NTP servers. The corresponding option(s) shall be chosen from the selection in FPT\_STM\_EXT.1.2. The use the automatic synchronisation with an external NTP server is recommended but not mandated. Note that for the communication with an external NTP server, FCS\_NTP\_EXT.1 shall be claimed. The ST author describes in the TSS how the external time and date information is received by the TOE and how this information is maintained.

The term "reliable time stamps" refers to the strict use of the time and date information, that is provided, and the logging of all discontinuous changes to the time settings including information about the old and new time. With this information, the real time for all audit data can be determined. Note, that all discontinuous time changes, Administrator actuated or changed via an automated process, must be audited. No audit is needed when time is changed via use of kernel or system facilities — such as daytime (3) — that exhibit no discontinuities in time.

For distributed TOEs it is expected that the Security Administrator ensures synchronization between the time settings of different TOE components. All TOE components shall either be in sync (e.g. through synchronisation between TOE components or through synchronisation of different TOE components with external NTP servers) or the offset should be known to the Administrator for every pair of TOE components. This includes TOE components synchronized to different time zones.

#### C.5 TOE Access (FTA)

#### C.5.1 TSF-initiated Session Locking (FTA SSL EXT)

#### **Family Behaviour**

Components in this family address the requirements for TSF-initiated and user-initiated locking, unlocking, and termination of interactive sessions.

The extended FTA SSL EXT family is based on the FTA SSL family.

#### **Component levelling**

FTA\_SSL\_EXT: TSF-initiated session locking | 1 | 1 | FTA\_SSL\_EXT.1 TSF-initiated session locking, requires system initiated locking of an interactive session after a specified period of inactivity. It is the only component of this family.

#### Management: FTA SSL EXT.1

The following actions could be considered for the management functions in FMT:

c) Specification of the time of user inactivity after which lock-out occurs for an individual user.

#### **Audit: FTA SSL EXT.1**

The following actions should be auditable if FAU\_GEN Security audit data generation is included in the PP/ST:

b) Any attempts at unlocking an interactive session.

#### C.5.1.1 FTA SSL EXT.1 TSF-initiated Session Locking

#### FTA SSL EXT.1 TSF-initiated Session Locking

Hierarchical to: No other components

Dependencies: FIA UAU.1 Timing of authentication

**FTA SSL EXT.1.1** The TSF shall, for local interactive sessions, [selection:

- lock the session disable any activity of the Administrator's data access/display devices other than unlocking the session, and requiring that the Administrator reauthenticate to the TSF prior to unlocking the session;
- *terminate the session*]

after a Security Administrator-specified time period of inactivity.

#### **C.6** Communication (FCO)

#### **C.6.1** Communication Partner Control (FCO CPC EXT)

#### **Family Behaviour**

This family is used to define high-level constraints on the ways that partner IT entities communicate. For example, there may be constraints on when communication channels can be used, how they are established, and links to SFRs expressing lower-level security properties of the channels.

#### **Component levelling**

FCO\_CPC\_EXT.1 Component Registration Channel Definition, requires the TSF to support a registration channel for joining together components of a distributed TOE, and to ensure that the availability of this channel is under the control of an Administrator. It also requires

statement of the type of channel used (allowing specification of further lower-level security requirements by reference to other SFRs).

### Management: FCO CPC EXT.1

No separate management functions are required. Note that elements of the SFR already specify certain constraints on communication in order to ensure that the process of forming a distributed TOE is a controlled activity.

### **Audit: FCO CPC EXT.1**

The following actions should be auditable if FCO CPC EXT.1 is included in the PP/ST:

- a) Enabling communications between a pair of components as in FCO\_CPC\_EXT.1.1 (including identities of the endpoints).
- b) Disabling communications between a pair of components as in FCO\_CPC\_EXT.1.3 (including identity of the endpoint that is disabled).

If the required types of channel in FCO\_CPC\_EXT.1.2 are specified by using other SFRs then the use of the registration channel may be sufficiently covered by the audit requirements on those SFRs: otherwise a separate audit requirement to audit the use of the channel should be identified for FCO\_CPC\_EXT.1.

### C.6.1.1FCO\_CPC\_EXT.1 Component Registration Channel Definition

#### FCO CPC EXT.1 Component Registration Channel Definition

Hierarchical to: No other components.

Dependencies: No other components.

**FCO\_CPC\_EXT.1.1** The TSF shall require a Security Administrator to enable communications between any pair of TOE components before such communication can take place.

**FCO\_CPC\_EXT.1.2** The TSF shall implement a registration process in which components establish and use a communications channel that uses [assignment: *list of different types of channel given in the form of a selection*] for at least [assignment: *type of data for which the channel must be used*].

**FCO\_CPC\_EXT.1.3** The TSF shall enable a Security Administrator to disable communications between any pair of TOE components.

#### Application Note 223

This SFR is generally applied to a distributed TOE in order to control the process of creating the distributed TOE from its components by means of a registration process in which a component joins the distributed TOE by registering with an existing component of the distributed TOE. When creating the TSF from the initial pair of components, either of these components may be identified as the TSF for the purposes of satisfying the meaning of "TSF" in this SFR.

The intention of this requirement is to ensure that there is a registration process that includes a positive enablement step by an Administrator before components joining a distributed TOE can communicate with the other components of the TOE and before the new component can act as part of the TSF. The registration process may itself involve communication with the joining component: many network devices use a bespoke process for this, and the security requirements for the "registration communication" are then defined in FCO\_CPC\_EXT.1.2. Use of this "registration communication" channel is not deemed inconsistent with the requirement of FCO\_CPC\_EXT.1.1 (i.e. the registration channel can be used before the enablement step, but only in order to complete the registration process).

# **D.** Entropy Documentation and Assessment

This appendix describes the required supplementary information for each entropy source used by the TOE.

The documentation of the entropy source(s) should be detailed enough that, after reading, the evaluator will thoroughly understand the entropy source and why it can be relied upon to provide sufficient entropy. This documentation should include multiple detailed sections: design description, entropy justification, operating conditions, and health testing. This documentation is not required to be part of the TSS.

## **D.1** Design Description

Documentation shall include the design of each entropy source as a whole, including the interaction of all entropy source components. Any information that can be shared regarding the design should also be included for any third-party entropy sources that are included in the product.

The documentation will describe the operation of the entropy source to include how entropy is produced, and how unprocessed (raw) data can be obtained from within the entropy source for testing purposes. The documentation should walk through the entropy source design indicating where the entropy comes from, where the entropy output is passed next, any post-processing of the raw outputs (hash, XOR, etc.), if/where it is stored, and finally, how it is output from the entropy source. Any conditions placed on the process (e.g., blocking) should also be described in the entropy source design. Diagrams and examples are encouraged.

This design must also include a description of the content of the security boundary of the entropy source and a description of how the security boundary ensures that an adversary outside the boundary cannot affect the entropy rate.

If implemented, the design description shall include a description of how third-party applications can add entropy to the RBG. A description of any RBG state saving between power-off and power-on shall be included.

## **D.2** Entropy Justification

There should be a technical argument for where the unpredictability in the source comes from and why there is confidence in the entropy source delivering sufficient entropy for the uses made of the RBG output (by this particular TOE). This argument will include a description of the expected min-entropy rate (i.e. the minimum entropy (in bits) per bit or byte of source data) and explain that sufficient entropy is going into the TOE randomizer seeding process. This discussion will be part of a justification for why the entropy source can be relied upon to produce bits with entropy.

The amount of information necessary to justify the expected min-entropy rate depends on the type of entropy source included in the product.

For developer-provided entropy sources, in order to justify the min-entropy rate, it is expected that a large number of raw source bits will be collected, statistical tests will be performed, and

the min-entropy rate determined from the statistical tests. While no particular statistical tests are required at this time, it is expected that some testing is necessary in order to determine the amount of min-entropy in each output.

For third-party provided entropy sources, in which the TOE vendor has limited access to the design and raw entropy data of the source, the documentation will indicate an estimate of the amount of min-entropy obtained from this third-party source. It is acceptable for the vendor to "assume" an amount of min-entropy, however, this assumption must be clearly stated in the documentation provided. In particular, the min-entropy estimate must be specified and the assumption included in the ST.

Regardless of the type of entropy source, the justification will also include how the DRBG is initialized with the entropy stated in the ST, for example by verifying that the min-entropy rate is multiplied by the amount of source data used to seed the DRBG or that the rate of entropy expected based on the amount of source data is explicitly stated and compared to the statistical rate. If the amount of source data used to seed the DRBG is not clear or the calculated rate is not explicitly related to the seed, the documentation will not be considered complete.

The entropy justification shall not include any data added from any third-party application or from any state saving between restarts.

## **D.3** Operating Conditions

The entropy rate may be affected by conditions outside the control of the entropy source itself. For example, voltage, frequency, temperature, and elapsed time after power-on are just a few of the factors that may affect the operation of the entropy source. As such, documentation will also include the range of operating conditions under which the entropy source is expected to generate random data. Similarly, documentation shall describe the conditions under which the entropy source is no longer guaranteed to provide sufficient entropy. Methods used to detect failure or degradation of the source shall be included.

## **D.4** Health Testing

More specifically, all entropy source health tests and their rationale will be documented. This will include a description of the health tests, the rate and conditions under which each health test is performed (e.g., at start up, continuously, or on-demand), the expected results for each health test, TOE behaviour upon entropy source failure, and rationale indicating why each test is believed to be appropriate for detecting one or more failures in the entropy source.

# E. Rationales

## **E.1** SFR Dependencies Analysis

The dependencies between SFRs implemented by the TOE are addressed as follows.

SFR	Dependencies	Rationale Statement
FAU_GEN.1	FPT_STM.1	FPT_STM_EXT.1 included

	_	included as optional SFRs
FAU_STG_EXT.2/LocSpace	FAU_GEN.1	FAU_GEN.1 &
	FAU STG EXT.1	FAU_STG_EXT.1
		included
FAU_STG.3/LocSpace	FAU_STG.1	FAU_STG.1 included as
		optional SFR
FIA_X509_EXT.1/ITT	FIA_X509_EXT.2	FIA_X509_EXT.2
		(selection-based SFR)
		included
FPT_ITT.1	None	
FTP_TRP.1/Join	None	
FCO_CPC_EXT.1	None	

Table 7: SFR Dependencies Rationale for Optional SFRs

SFR	Dependencies	Rationale Statement
FAU_GEN_EXT.1	None	
FAU_STG_EXT.3	FAU_GEN_EXT.1,	FAU_GEN_EXT.1
	[FPT_ITT.1 or	included
	FTP_ITC.1]	FPT_ITT.1 (optional SFR)
		and FTP_ITC.1
		(mandatory SFR) included.
FAU_STG_EXT.4	FAU_GEN_EXT.1,	FAU_GEN_EXT.1
	[FPT_ITT.1 or	included
	FTP_ITC.1]	FPT_ITT.1 (optional SFR)
		and FTP_ITC.1
		(mandatory SFR) included.
FIA_X509_EXT.1/Rev	FIA_X509_EXT.2	FIA_X509_EXT.2
		(selection-based SFR)
		included
FIA_X509_EXT.2	FIA_X509_EXT.1	FIA_X509_EXT.1
		(selection-based SFR)
		included
FIA_X509_EXT.3	FCS_CKM.1	FCS_CKM.1 included
	FIA_X509_EXT.1	(mandatory SFR)
		FIA_X509_EXT.1
		(selection-based SFR)
Tog pay ag Tym 1		included
FCS_DTLSC_EXT.1	FCS_CKM.1	FCS_CKM.1 included
	FCS_CKM.2	FCS_CKM.2 included
	FCS_COP.1/DataEncrypti	FCS_COP.1/DataEncrypti
	on Total Control	on, FCS_COP.1/SigGen,

	FMT_SMF.1	FMT_SMF.1 included
FMT_MOF.1/Service	FMT_SMR.1	FMT_SMR.2 included
	FMT_SMF.1	FMT_SMF.1 included
FMT_MOF.1/Functions	FMT_SMR.1	FMT_SMR.2 included
	FMT_SMF.1	FMT_SMF.1 included
FMT_MTD.1/CryptoKeys	FMT_SMR.1	FMT_SMR.2 included
	FMT_SMF.1	FMT_SMF.1 included

Table 8: SFR Dependencies Rationale for Selection-Based SFRs

# Glossary

Term	Meaning
Administrator	See Security Administrator.
Assurance	Grounds for confidence that a TOE meets the SFRs [CC1].
Security Administrator	The terms "Administrator" and "Security Administrator" are used interchangeably in this document at present.
Target of Evaluation	A set of software, firmware and/or hardware possibly accompanied by guidance. [CC1]
TOE Security Functionality (TSF)	A set consisting of all hardware, software, and firmware of the TOE that must be relied upon for the correct enforcement of the SFRs. [CC1]
TSF Data	Data for the operation of the TSF upon which the enforcement of the requirements relies.
User	See Security Administrator

See [CC1] for other Common Criteria abbreviations and terminology.

# Acronyms

Acronym	Meaning
AEAD	Authenticated Encryption with Associated Data
AES	Advanced Encryption Standard
CA	Certificate Authority
CBC	Cipher Block Chaining
CRL	Certificate Revocation List
DH	Diffie-Hellman
DSA	Digital Signature Algorithm
DTLS	Datagram Transport Layer Security
ECDH	Elliptic Curve Diffie Hellman
ECDSA	Elliptic Curve Digital Signature Algorithm
<b>EEPROM</b>	Electrically Erasable Programmable Read-Only Memory
FIPS	Federal Information Processing Standards
GCM	Galois Counter Mode
HMAC	Keyed-Hash Message Authentication Code
HTTPS	HyperText Transfer Protocol Secure
IP	Internet Protocol
IPsec	Internet Protocol Security
NIST	National Institute of Standards and Technology
NTP	Network Time Protocol
OCSP	Online Certificate Status Protocol
PP	Protection Profile
RBG	Random Bit Generator
RSA	Rivest Shamir Adleman Algorithm
SD	Supporting Document
SHA	Secure Hash Algorithm
SSH	Secure Shell
ST	Security Target
TLS	Transport Layer Security
TOE	Target of Evaluation
TSF	TOE Security Functionality
TSS	TOE Summary Specification
VPN	Virtual Private Network
