108        **1 Introduction**

109        **1.1 ST and TOE reference**

110	Title:	Security Target, SMGW Version 1.1.1
111	Sponsors:	OpenLimit SignCubes AG, Power Plus Communications AG
112	Editors:	OpenLimit SignCubes AG, Power Plus Communications AG
113	CC-Version:	3.1 Revision 5
114	Assurance Level:	EAL 4+, augmented by AVA_VAN.5 and ALC_FLR.2
115	General Status:	Final
116	Document Version:	4.6
117	Document Date:	02.02.2021
118	TOE:	SMGW Version 1.1.1
119	Certification ID:	BSI-DSZ-CC-0831_v2

120        This document contains the security target of the *SMGW Version 1.1.1*.

121        This security target claims conformance to the *Smart Meter Gateway* protection profile  
122        [PP\_GW].

123        **1.2 TOE reference**

124        The TOE described in this security target is the *SMGW Version 1.1.1*.

125        The TOE is part of the device "*Smart Meter Gateway*". It consists of "*SMGW Software Version*  
126        *1.1.1*" and "*SMGW Hardware*" where the hardware version can be identified according to  
127        Table 1.

128        The following classifications of the product "*Smart Meter Gateway*" contain the TOE:

- 129        • *BPL Smart Meter Gateway* (BPL-SMGW), SMGW-B-1A-111-00 or SMGW-B-1B-111-00
- 130        • *CDMA Smart Meter Gateway* (CDMA-SMGW), SMGW-C-1A-111-00
- 131        • *ETH Smart Meter Gateway* (ETH-SMGW), SMGW-E-1A-111-00 or SMGW-E-1B-111-00
- 132        • *GPRS Smart Meter Gateway* (GPRS-SMGW), SMGW-G-1A-111-30

- 133
- 134
- 135
- *LTE Smart Meter Gateway (LTE-SMGW)*, SMGW-L-1A-111-30, SMGW-L-1A-111-10, SMGW-L-1B-111-30 or SMGW-L-1B-111-10
  - *powerWAN-ETH Smart Meter Gateway (pWE-SMGW)*, SMGW-P-1B-111-00

136 The TOE comprises the following parts:

- 137
- 138
- 139
- 140
- 141
- 142
- 143
- 144
- 145
- hardware device according to Table 1, including the TOE's main circuit board, a carrier board, a power-supply unit and a radio module for communication with wireless meter (included in the hardware device "*Smart Meter Gateway*")
  - firmware including software application "*SMGW Software Version 1.1.1*" (loaded into the circuit board according to Table 1), identified by the value 32222-32349 which comprises of two revision numbers of the underlying version control system for the TOE, where the first part is for the operating system and the second part is for the SMGW application
  - manuals
    - „Handbuch für Verbraucher, Smart Meter Gateway“ [AGD\_Consumer], identified by the SHA-256 hash value 17ea1076cf21b1c97608459dbaa2ef402c68fa1adee6189d69bbbcabb586a2df
    - „Handbuch für Service-Techniker, Smart Meter Gateway“ [AGD\_Techniker], identified by the SHA-256 hash value b1fa0be534c0dfd41bcae4dedd5dcfc797ee08155f14cc4c6575da1851d8af62
    - „Handbuch für Hersteller von Smart-Meter Gateway-Administrations-Software, Smart Meter Gateway“ [AGD\_GWA], identified by the SHA-256 hash value 3f65d281982a16fbadc2515f010d8fab75c56af7250dcee949bd97cc4c8df743
    - „Logmeldungen, SMGW Version 1.1“ [SMGW\_Logging] identified by the SHA-256 hash value 9f1bcfc3c7bf7edba364d44d145dea8dbbb49e760525b825fd40e1c0ac257b79
    - „Auslieferungs- und Fertigungsprozeduren, Anhang Sichere Auslieferung, SMGW Version 1.1“ [AGD\_SEC], identified by the SHA-256 hash value dbf82120d484e7225a931433c7b8d9d0b3efd4262396d8f338e5b4b68b38657f
- 146

- 155
- 156
- 157
- 158
- 159
- 160
- 161

162 The hardware device “*Smart Meter Gateway*” includes a secure module with the product  
 163 name “*TCOS Smart Meter Security Module Version 1.0 Release 2/P60C144PVE*” which is not  
 164 part of the TOE but has its own certification id “BSI-DSZ-CC-0957-V2-2016”. Moreover, a  
 165 hard-wired communication adapter is connected to the TOE via [USB] as shown in Figure 3  
 166 which is not part of the TOE (but always an inseparable part of the delivered entity). This  
 167 communication adapter can be either a LTE communication adapter, a BPL communication  
 168 adapter, a GPRS communication adapter, a CDMA communication adapter, a powerWAN-  
 169 Ethernet communication adapter, or an ethernet communication adapter.

170 The following table shows the different TOE product classifications applied on the case of the  
 171 TOE:

#	Characteristic	Value	Description
1	Product family	SMGW	each classification of a type start with this value
2		-	<i>Delimiter</i>
3	Communication Technology	B	Product Type „BPL Smart Meter Gateway“
		C	Product Type „CDMA Smart Meter Gateway“
		E	Product Type „ETH Smart Meter Gateway“
		G	Product Type „GPRS Smart Meter Gateway“
		L	Product Type „LTE Smart Meter Gateway“
		P	Product Type „powerWAN-ETH Smart Meter Gateway“
4		-	<i>Delimiter</i>
5	Hardware generation	1A	Identification of hardware generation; version 1.0 of main circuit board “SMGW Hardware”
		1B	Identification of hardware generation; version 1.0.1 of main circuit board “SMGW Hardware”(with new power adapter)
6		-	<i>Delimiter</i>
7	HAN Interface	1	Ethernet
8	CLS Interface	1	Ethernet
9	LMN Interface	1	Wireless and wired
10		-	<i>Delimiter</i>
11	SIM card type	0	<i>none</i>
		1	SIM card assembled at factory
		3	SIM slot only
12	reserved	0	

172 **Table 1: TOE product classifications**

---

### 173           **1.3 Introduction**

174           The increasing use of *green energy* and upcoming technologies around e-mobility lead to an  
175           increasing demand for functions of a so called smart grid. A smart grid hereby refers to a  
176           commodity<sup>1</sup> network that intelligently integrates the behaviour and actions of all entities  
177           connected to it – suppliers of natural resources and energy, its consumers and those that are  
178           both – in order to efficiently ensure a more sustainable, economic and secure supply of a  
179           certain commodity (definition adopted from [CEN]).

180           In its vision such a smart grid would allow to invoke consumer devices to regulate the load  
181           and availability of resources or energy in the grid, e.g. by using consumer devices to store  
182           energy or by triggering the use of energy based upon the current load of the grid<sup>2</sup>. Basic  
183           features of such a smart use of energy or resources are already reality. Providers of electricity  
184           in Germany, for example, have to offer at least one tariff that has the purpose to motivate  
185           the consumer to save energy.

186           In the past, the production of electricity followed the demand/consumption of the  
187           consumers. Considering the strong increase in renewable energy and the production of  
188           energy as a side effect in heat generation today, the consumption/demand has to follow the  
189           – often externally controlled – production of energy. Similar mechanisms can exist for the gas  
190           network to control the feed of biogas or hydrogen based on information submitted by  
191           consumer devices.

192           An essential aspect for all considerations of a smart grid is the so called *Smart Metering*  
193           *System* that meters the consumption or production of certain commodities at the  
194           consumers' side and allows sending the information about the consumption or production to  
195           external entities, which is then the basis for e. g. billing the consumption or production.

---

1           Commodities can be electricity, gas, water or heat which is distributed from its generator to the consumer through a grid (network).

2           Please note that such a functionality requires a consent or a contract between the supplier and the consumer, alternatively a regulatory requirement.

---

196 This Security Target defines the security objectives, corresponding requirements and their  
197 fulfilment for a Gateway which is the central communication component of such a Smart  
198 Metering System (please refer to chapter 1.4.2 for a more detailed overview).

199 The Target of Evaluation (TOE) that is described in this document is an electronic unit  
200 comprising hardware and software/firmware<sup>3</sup> used for collection, storage and provision of  
201 Meter Data<sup>4</sup> from one or more Meters of one or multiple commodities.

202 The Gateway connects a Wide Area Network (WAN) with a Network of Devices of one or  
203 more Smart Metering devices (Local Metrological Network, LMN) and the consumer Home  
204 Area Network (HAN), which hosts Controllable Local Systems (CLS) and visualization devices.  
205 The security functionality of the TOE comprises

- 206 • protection of confidentiality, authenticity, integrity of data and
- 207 • information flow control

208 mainly to protect the privacy of consumers, to ensure a reliable billing process and to protect  
209 the Smart Metering System and a corresponding large scale infrastructure of the smart grid.  
210 The availability of the Gateway is not addressed by this ST.

## 211 **1.4 TOE Overview**

### 212 **1.4.1 Introduction**

213 The TOE as defined in this Security Target is the Gateway in a Smart Metering System. In the  
214 following subsections the overall Smart Metering System will be described first and  
215 afterwards the Gateway itself.

216 There are various different vocabularies existing in the area of Smart Grid, Smart Metering  
217 and Home Automation. Furthermore, the Common Criteria maintain their own vocabulary.

---

<sup>3</sup> For the rest of this document the term “firmware” will be used if the complete firmware is meant. For the application including its services the term “software” will be used.

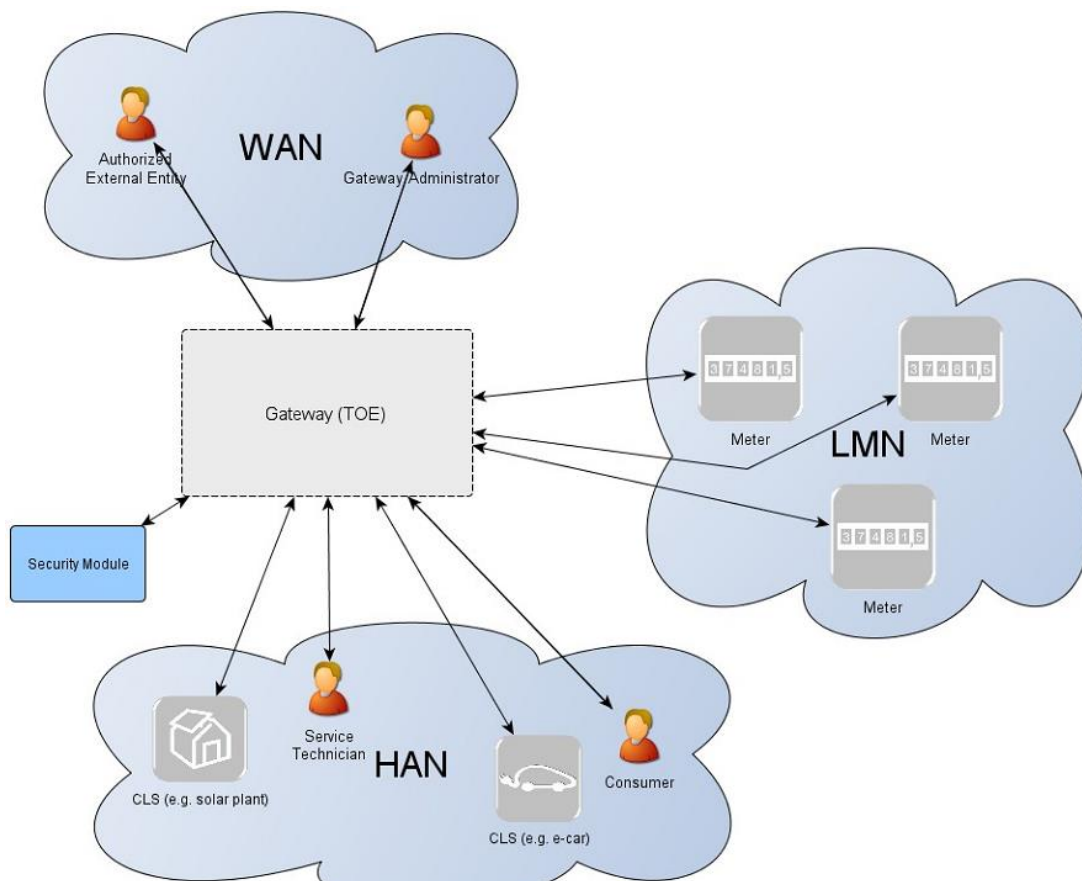

<sup>4</sup> Please refer to chapter 3.2 for an exact definition of the term “Meter Data”.

---

218 The Protection Profile [PP\_GW, chapter 1.3] provides an overview over the most prominent  
 219 terms used in this Security Target to avoid any bias which is not fully repeated here.

220 **1.4.2 Overview of the Gateway in a Smart Metering System**

221 The following figure provides an overview of the TOE as part of a complete Smart Metering  
 222 System from a purely functional perspective as used in this ST.<sup>5</sup>

223 **Figure 1: The TOE and its direct environment**

224  
 225

---

<sup>5</sup> It should be noted that this description purely contains aspects that are relevant to motivate and understand the functionalities of the Gateway as described in this ST. It does not aim to provide a universal description of a Smart Metering System for all application cases.

---

226 As can be seen in Figure 1, a system for smart metering comprises different functional units  
227 in the context of the descriptions in this ST:

- 228 • The **Gateway** (as defined in this ST) serves as the communication component  
229 between the components in the local area network (LAN) of the consumer and the  
230 outside world. It can be seen as a special kind of firewall dedicated to the smart  
231 metering functionality. It also collects, processes and stores the records from  
232 Meter(s) and ensures that only authorised parties have access to them or derivatives  
233 thereof. Before sending meter data<sup>6</sup> the information will be encrypted and signed  
234 using the services of a Security Module. The Gateway features a mandatory user  
235 interface, enabling authorised consumers to access the data relevant to them.
- 236 • The **Meter** itself records the consumption or production of one or more commodities  
237 (e.g. electricity, gas, water, heat) and submits those records in defined intervals to  
238 the Gateway. The Meter Data has to be signed and encrypted before transfer in  
239 order to ensure its confidentiality, authenticity, and integrity. The Meter is  
240 comparable to a classical meter<sup>7</sup> and has comparable security requirements; it will  
241 be sealed as classical meters according to the regulations of the calibration authority.  
242 The Meter further supports the encryption and integrity protection of its connection  
243 to the Gateway<sup>8</sup>.
- 244 • The Gateway utilises the services of a **Security Module** (e.g. a smart card) as a  
245 cryptographic service provider and as a secure storage for confidential assets. The  
246 Security Module will be evaluated separately according to the requirements in the  
247 corresponding Protection Profile (c.f. [SecModPP]).

248 **Controllable Local Systems** (CLS, as shown in Figure 2) may range from local power  
249 generation plants, controllable loads such as air condition and intelligent household  
250 appliances (“white goods”) to applications in home automation. CLS may utilise the services

---

<sup>6</sup> Please note that readings and data which are not relevant for billing may require an explicit endorsement of the consumer.

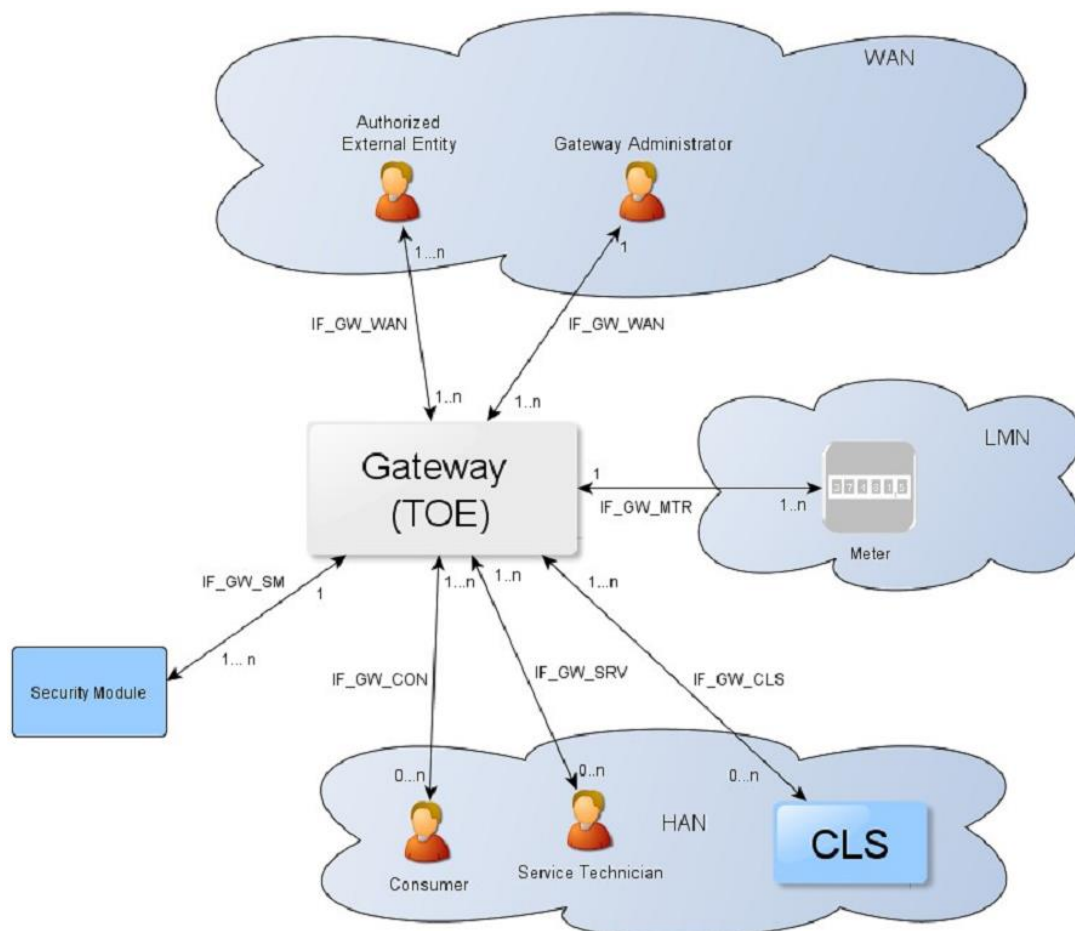

<sup>7</sup> In this context, a classical meter denotes a meter without a communication channel, i.e. whose values have to be read out locally.

<sup>8</sup> It should be noted that this ST does not imply that the connection between the Gateways and external components (specifically meters and CLS) is cable based. It is also possible that the connections as shown in Figure 1 are realised deploying a wireless technology. However, the requirements on how the connections shall be secured apply regardless of the realisation.

---

251 of the Gateway for communication services. However, CLS are not part of the Smart  
 252 Metering System.

253 The following figure introduces the external interfaces of the TOE and shows the cardinality  
 254 of the involved entities. Please note that the arrows of the interfaces within the Smart  
 255 Metering System as shown in Figure 2 indicate the flow of information. However, it does not  
 256 indicate that a communication flow can be initiated bi-directionally. Indeed, the following  
 257 chapters of this ST will place dedicated requirements on the way an information flow can be  
 258 initiated<sup>9</sup>.

**Figure 2: The logical interfaces of the TOE**

259  
 260

<sup>9</sup> Please note that the cardinality of the interface to the consumer is 0..n as it cannot be assumed that a consumer is interacting with the TOE at all.

261 The overview of the Smart Metering System as described before is based on a threat model  
262 that has been developed for the Smart Metering System and has been motivated by the  
263 following considerations:

- 264 • The Gateway is the central communication unit in the Smart Metering System. It is  
265 the only unit directly connected to the WAN, to be the first line of defence an  
266 attacker located in the WAN would have to conquer.
- 267 • The Gateway is the central component that collects, processes and stores Meter  
268 Data. It therewith is the primary point for user interaction in the context of the Smart  
269 Metering System.
- 270 • To conquer a Meter in the LMN or CLS in the HAN (that uses the TOE for  
271 communication) a WAN attacker first would have to attack the Gateway successfully.  
272 All data transferred between LAN and WAN flows via the Gateway which makes it an  
273 ideal unit for implementing significant parts of the system's overall security  
274 functionality.
- 275 • Because a Gateway can be used to connect and protect multiple Meters (while a  
276 Meter will always be connected to exactly one Gateway) and CLS with the WAN,  
277 there might be more Meters and CLS in a Smart Metering System than there are  
278 Gateways.

279 All these arguments motivated the approach to have a Gateway (using a Security Module for  
280 cryptographic support), which is rich in security functionality, strong and evaluated in depth,  
281 in contrast to a Meter which will only deploy a minimum of security functions. The Security  
282 Module will be evaluated separately.

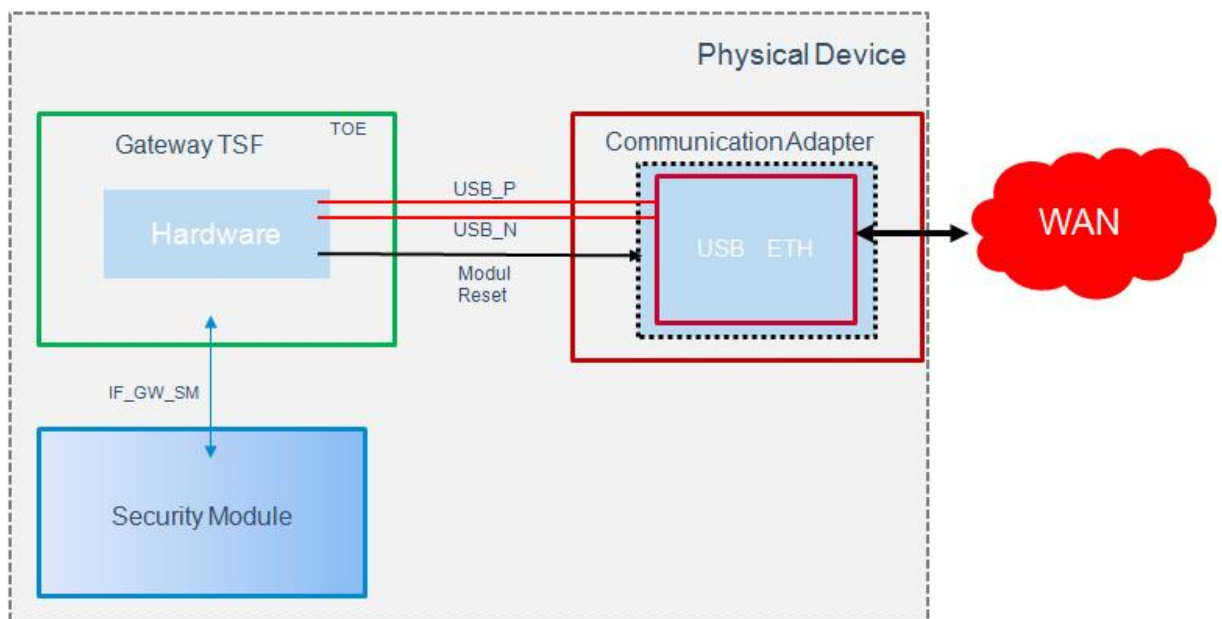

### 283 **1.4.3 TOE description**

284 The Smart Metering Gateway (in the following short: Gateway or TOE) may serve as the  
285 communication unit between devices of private and commercial consumers and service  
286 providers of a commodity industry (e.g. electricity, gas, water, etc.). It also collects, processes  
287 and stores Meter Data and is responsible for the distribution of this data to external entities.

288 Typically, the Gateway will be placed in the household or premises of the consumer<sup>10</sup> of the  
 289 commodity and enables access to local Meter(s) (i.e. the unit(s) used for measuring the  
 290 consumption or production of electric power, gas, water, heat etc.) and may enable access to  
 291 Controllable Local Systems (e.g. power generation plants, controllable loads such as air  
 292 condition and intelligent household appliances).

293 The TOE has a fail-safe design that specifically ensures that any malfunction can not impact  
 294 the delivery of a commodity, e.g. energy, gas or water<sup>11</sup>.

295 The following figure provides an overview of the product with its TOE and non-TOE parts:

296  
 297 Figure 3: The product with its TOE and non-TOE parts

298 The TOE communicates over the interface *IF\_GW\_SM* with a security module and over the  
 299 interfaces *USB\_P*, *USB\_N* and *Module Reset* with one of the possible communication

<sup>10</sup> Please note that it is possible that the consumer of the commodity is not the owner of the premises where the Gateway will be placed. However, this description acknowledges that there is a certain level of control over the physical access to the Gateway.

<sup>11</sup> Indeed, this Security Target assumes that the Gateway and the Meters have no possibility at all to impact the delivery of a commodity. Even an intentional stop of the delivery of a certain commodity is Not within the scope of this Security Target. It should, however, be noted that such a functionality may be realised by a CLS that utilises the services of the TOE for its communication.

300 adapters according to chapter 1.2. The communication adapters, which are not part of the  
301 TOE, transmit data from the USB interface to the WAN ethernet interface and vice versa.

#### 302 **1.4.4 TOE Type definition**

303 At first, the TOE is a communication Gateway. It provides different external communication  
304 interfaces and enables the data communication between these interfaces and connected IT  
305 systems. It further collects, processes and stores Meter Data and is responsible for the  
306 distribution of this data to external parties.

307 Typically, the Gateway will be placed in the household or premises of the consumer of the  
308 commodity and enables access to local Meter(s) (i.e. the unit(s) used for measuring the  
309 consumption or production of electric power, gas, water, heat etc.) and may enable access to  
310 Controllable Local Systems (e.g. power generation plants, controllable loads such as air  
311 condition and intelligent household appliances). Roles respectively External Entities in the  
312 context of the TOE are introduced in chapter 3.1.

313 The TOE described in this ST is a product that has been developed in partnership between  
314 Power Plus Communication AG and OpenLimit SignCubes AG. It is a communication product  
315 which complies with the requirements of the Protection Profile “Protection Profile for the  
316 Gateway of a Smart Metering System” [PP\_GW]. Moreover, the TOE postulates compliance  
317 to the technical guideline [TR-03109] which is not part of this security evaluation and  
318 certification<sup>12</sup>. The basis for the conformity check to [TR-03109] will be the functional and  
319 security related tests performed during the security evaluation. The TOE consists of hardware  
320 and software including the operating system. The communication with more than one meter  
321 is possible.

322 The TOE is implemented as a separate physical module which can be integrated into more  
323 complex modular systems. This means that the TOE can be understood as an OEM module

---

<sup>12</sup> The TOE deviates from the technical guideline [TR-03109] in the following points: The TOE only supports wireless meter in operational mode S1 and T1 and the SML commands *SML\_PublicOpen.\**, *SML\_PublicClose.\**, *SML\_GetProcParameter.\**, *SML\_SetProcParameter.Reg* with parameters *serverId*, *parameterTreePath*, *parameterTree* only, and *SML\_Attention.Res*.

324 which provides all required physical interfaces and protocols on well defined interfaces.  
325 Because of this, the module can be integrated into communication devices and directly into  
326 meters.

327 The TOE-design includes the following components:

- 328 • The security relevant components compliant to the Protection Profile.
- 329 • Components with no security relevance (e.g. communication protocols and  
330 interfaces).

331 The TOE evaluation does not include the evaluation of the Security Module. In fact, the TOE  
332 relies on the security functionality of the Security Module but it must be security evaluated in  
333 a separate security evaluation<sup>13</sup>.

334 The hardware platform of the TOE mainly consists of a suitable embedded CPU, volatile and  
335 non-volatile memory and supporting circuits like Security Module and RTC.

336 The TOE contains mechanisms for the integrity protection for its firmware.

337 The TOE supports the following communication protocols:

- 338 • OBIS according to [IEC-62056-6-1] and [EN 13757-1],
- 339 • DLMS/COSEM according to [IEC-62056-6-2],
- 340 • SML according to [IEC-62056-5-3-8],
- 341 • unidirectional and bidirectional wireless M-Bus according to [EN 13757-3],  
342 [EN 13757-4], and [IEC-62056-21].

343 The TOE provides the following physical interfaces for communication

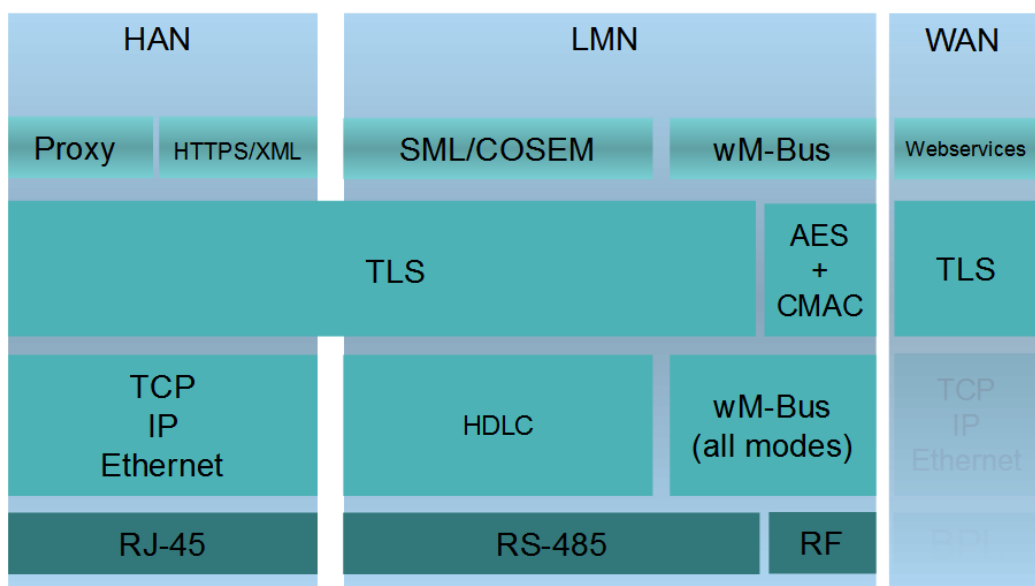

- 344 • Wireless M-Bus (LMN) according to [EN 13757-3],
- 345 • RS-485 (LMN) according to [EIA RS-485],
- 346 • Ethernet (HAN) according to [IEEE 802.3], and
- 347 • RMII (WAN) according to [IEEE 802.3].

---

<sup>13</sup> Please note that the Security Module is physically integrated into the Gateway even though it is not part of the TOE.

348 The physical interface for the WAN communication is the RMII (Reduced Media Independent  
 349 Interface) interface. The communication is protected according to [TR-03109].

350 The communication into the HAN is also provided by the Ethernet interface. The protocols  
 351 HTTPS and TLS proxy are therefore supported.

352

353

**Figure 4: The TOE's protocol stack**

354 The TOE provides the following functionality:

- 355 • Protected handling of Meter Data compliant to [PP\_GW, chapter 1.4.6.1 and 1.4.6.2]
- 356 • Integrity and authenticity protection e. g. of Meter Data compliant to [PP\_GW,  
 357 chapter 1.6.4.3]
- 358 • Protection of LAN devices against access from the WAN compliant to [PP\_GW,  
 359 chapter 1.4.6.4]
- 360 • Wake-Up Service compliant to [PP\_GW, chapter 1.4.6.5]
- 361 • Privacy protection compliant to [PP\_GW, chapter 1.4.6.6]
- 362 • Management of Security Functions compliant to [PP\_GW, chapter 1.4.6.7]
- 363 • Cryptography of the TOE and its Security Module compliant to [PP\_GW, chapter  
 364 1.4.8]

#### 365 **1.4.5 TOE logical boundary**

366 The logical boundary of the Gateway can be defined by its security features:

- 367 • *Handling of Meter Data*, collection and processing of Meter Data, submission to
- 368 authorised external entities (e.g. one of the service providers involved) where
- 369 necessary protected by a digital signature
- 370 • *Protection of authenticity, integrity and confidentiality* of data temporarily or
- 371 persistently stored in the Gateway, transferred locally within the LAN and transferred
- 372 in the WAN (between Gateway and authorised external entities)
- 373 • *Firewalling* of information flows to the WAN and information flow control among
- 374 Meters, Controllable Local Systems and the WAN
- 375 • *A Wake-Up-Service* that allows to contact the TOE from the WAN side
- 376 • *Privacy preservation*
- 377 • *Management of Security Functionality*
- 378 • *Identification and Authentication* of TOE users

379 The following sections introduce the security functionality of the TOE in more detail.

##### 380 **1.4.5.1 Handling of Meter Data<sup>14</sup>**

381 The Gateway is responsible for handling Meter Data. It receives the Meter Data from the  
382 Meter(s), processes it, stores it and submits it to external entities.

383 The TOE utilises Processing Profiles to determine which data shall be sent to which  
384 component or external entity. A Processing Profile defines:

- 385 • how Meter Data must be processed,
- 386 • which processed Meter Data must be sent in which intervals,
- 387 • to which component or external entity,
- 388 • signed using which key material,
- 389 • encrypted using which key material,

---

<sup>14</sup> Please refer to chapter 3.2 for an exact definition of the various data types.

- 390
- whether processed Meter Data shall be pseudonymised or not, and
- 391
- which pseudonym shall be used to send the data.

392 The Processing Profiles are not only the basis for the security features of the TOE; they also  
393 contain functional aspects as they indicate to the Gateway how the Meter Data shall be  
394 processed. More details on the Processing Profiles can be found in [TR-03109-1].

395 The Gateway restricts access to (processed) Meter Data in the following ways:

- 396
- consumers must be identified and authenticated first before access to any data may  
397 be granted,
- 398
- the Gateway accepts Meter Data from authorised Meters only,
- 399
- the Gateway sends processed Meter Data to correspondingly authorised external  
400 entities only.

401 The Gateway accepts data (e.g. configuration data, firmware updates) from correspondingly  
402 authorised Gateway Administrators or correspondingly authorised external entities only. This  
403 restriction is a prerequisite for a secure operation and therewith for a secure handling of  
404 Meter Data. Further, the Gateway maintains a calibration log with all relevant events that  
405 could affect the calibration of the Gateway.

406 These functionalities:

- 407
- prevent that the Gateway accepts data from or sends data to unauthorised entities,
- 408
- ensure that only the minimum amount of data leaves the scope of control of the  
409 consumer,
- 410
- preserve the integrity of billing processes and as such serve in the interests of the  
411 consumer as well as in the interests of the supplier. Both parties are interested in an  
412 billing process that ensures that the value of the consumed amount of a certain  
413 commodity (and only the used amount) is transmitted,
- 414
- preserve the integrity of the system components and their configurations.

415 The TOE offers a local interface to the consumer (see also IF\_GW\_CON in Figure 2) and allows  
416 the consumer to obtain information via this interface. This information comprises the billing-

---

417 relevant data (to allow the consumer to verify an invoice) and information about which  
418 Meter Data has been and will be sent to which external entity. The TOE ensures that the  
419 communication to the consumer is protected by using TLS and ensures that consumers only  
420 get access to their own data. Therefore, the TOE contains a web server that delivers the  
421 content to the web browser after successful authentication of the user.

#### 422 **1.4.5.2 Confidentiality protection**

423 The TOE protects data from unauthorised disclosure

- 424 • while received from a Meter via the LMN,
- 425 • while received from the administrator via the WAN,
- 426 • while temporarily stored in the volatile memory of the Gateway,
- 427 • while transmitted to the corresponding external entity via the WAN or HAN.

428 Furthermore, all data, which no longer have to be stored in the Gateway, are securely erased  
429 to prevent any form of access to residual data via external interfaces of the TOE. These  
430 functionalities protect the privacy of the consumer and prevent that an unauthorised party is  
431 able to disclose any of the data transferred in and from the Smart Metering System (e.g.  
432 Meter Data, configuration settings).

433 The TOE utilises the services of its Security Module for aspects of this functionality.

#### 434 **1.4.5.3 Integrity and Authenticity protection**

435 The Gateway provides the following authenticity and integrity protection:

- 436 • Verification of authenticity and integrity when receiving Meter Data from a Meter via  
437 the LMN, to verify that the Meter Data have been sent from an authentic Meter and  
438 have not been altered during transmission. The TOE utilises the services of its  
439 Security Module for aspects of this functionality.
  - 440 • Application of authenticity and integrity protection measures when sending  
441 processed Meter Data to an external entity, to enable the external entity to verify
-

442 that the processed Meter Data have been sent from an authentic Gateway and have  
443 not been changed during transmission. The TOE utilises the services of its Security  
444 Module for aspects of this functionality.

- 445 • Verification of authenticity and integrity when receiving data from an external entity  
446 (e.g. configuration settings or firmware updates) to verify that the data have been  
447 sent from an authentic and authorised external entity and have not been changed  
448 during transmission. The TOE utilises the services of its Security Module for aspects  
449 of this functionality.

450 These functionalities

- 451 • prevent within the Smart Metering System that data may be sent by a non-authentic  
452 component without the possibility that the data recipient can detect this,
- 453 • facilitate the integrity of billing processes and serve for the interests of the consumer  
454 as well as for the interest of the supplier. Both parties are interested in the  
455 transmission of correct processed Meter Data to be used for billing,
- 456 • protect the Smart Metering System and a corresponding large scale Smart Grid  
457 infrastructure by preventing that data (e.g. Meter Data, configuration settings, or  
458 firmware updates) from forged components (with the aim to cause damage to the  
459 Smart Grid) will be accepted in the system.

#### 460 **1.4.5.4 Information flow control and firewall**

461 The Gateway separates devices in the LAN of the consumer from the WAN and enforces the  
462 following information flow control to control the communication between the networks that  
463 the Gateway is attached to:

- 464 • only the Gateway may establish a connection to an external entity in the WAN<sup>15</sup>;  
465 specifically connection establishment by an external entity in the WAN or a Meter in  
466 the LMN to the WAN is not possible,

---

<sup>15</sup> Please note that this does not affect the functionality for a CLS to establish a secure channel to a party in the WAN. Technically however, this channel is established by the TOE who acts as a proxy between the CLS and the WAN.

---

- 467
- the Gateway can establish connections to devices in the LMN or in the HAN,
- 468
- Meters in the LMN are only allowed to establish a connection to the Gateway,
- 469
- the Gateway shall offer a wake-up service that allows external entities in the WAN to
- 470
- trigger a connection establishment by the Gateway,
- 471
- connections are allowed to pre-configured addresses only,
- 472
- only cryptographically-protected (i.e. encrypted, integrity protected and mutually
- 473
- authenticated) connections are possible.<sup>16</sup>

474 These functionalities

- prevent that the Gateway itself or the components behind the Gateway (i.e. Meters or Controllable Local Systems) can be conquered by a WAN attacker (as defined in section 3.4), that processed data are transmitted to the wrong external entity, and that processed data are transmitted without being confidentiality/authenticity/integrity-protected,
- protect the Smart Metering System and a corresponding large scale infrastructure in two ways: by preventing that conquered components will send forged Meter Data (with the aim to cause damage to the Smart Grid), and by preventing that widely distributed Smart Metering Systems can be abused as a platform for malicious software/firmware to attack other systems in the WAN (e.g. a WAN attacker who would be able to install a botnet on components of the Smart Metering System).

486 The communication flows that are enforced by the Gateway between parties in the HAN,  
 487 LMN and WAN are summarized in the following table<sup>17</sup>:

Source(1st column)	WAN	LMN	HAN
Destination (1st row)			
WAN	- (see following list)	No connection	No connection

<sup>16</sup> To establish an encrypted channel the TOE may use the required protocols such as DHCP or PPP. Beside the establishment of an encrypted channel no unprotected communication between the TOE and external entities located in the WAN or LAN is allowed.

<sup>17</sup> Please note that this table only addresses the communication flow between devices in the various networks attached to the Gateway. It does not aim to provide an overview over the services that the Gateway itself offers to those devices nor an overview over the communication between devices in the same network. This information can be found in the paragraphs following the table.

		establishment allowed	establishment allowed
<b>LMN</b>	No connection establishment allowed	- (see following list)	No connection establishment allowed
<b>HAN</b>	Connection establishment is allowed to trustworthy, pre-configured endpoints and via an encrypted channel only <sup>18</sup>	No connection establishment allowed	- (see following list)

488 **Table 2: Communication flows between devices in different networks**

489 For communications within the different networks the following assumptions are defined:

- 490 1. Communications within the **WAN** are not restricted. However, the Gateway is not
- 491 involved in this communication,
- 492 2. No communications between devices in the **LMN** are assumed. Devices in the LMN
- 493 may only communicate to the Gateway and shall not be connected to any other
- 494 network,
- 495 3. Devices in the **HAN** may communicate with each other. However, the Gateway is not
- 496 involved in this communication. If devices in the HAN have a separate connection to
- 497 parties in the WAN (beside the Gateway) this connection is assumed to be
- 498 appropriately protected. It should be noted that for the case that a TOE connects to
- 499 more than one HAN communications between devices within different HAN via the
- 500 TOE are only allowed if explicitly configured by a Gateway Administrator.

501 Finally, the Gateway itself offers the following services within the various networks:

- 502 • the Gateway accepts the submission of Meter Data from the LMN,
- 503 • the Gateway offers a wake-up service at the WAN side as described in chapter
- 504 1.4.6.5 of [PP\_GW],
- 505 • the Gateway offers a user interface to the HAN that allows CLS or consumers to
- 506 connect to the Gateway in order to read relevant information.

---

18 The channel to the external entity in the WAN is established by the Gateway.

---

507           **1.4.5.5 Wake-Up-Service**

508           In order to protect the Gateway and the devices in the LAN against threats from the WAN  
509           side the Gateway implements a strict firewall policy and enforces that connections with  
510           external entities in the WAN shall only be established by the Gateway itself (e.g. when the  
511           Gateway delivers Meter Data or contacts the Gateway Administrator to check for updates)<sup>19</sup>.

512           While this policy is the optimal policy from a security perspective, the Gateway Administrator  
513           may want to facilitate applications in which an instant communication to the Gateway is  
514           required.

515           In order to allow this kind of re-activeness of the Gateway, this ST allows the Gateway to  
516           keep existing connections to external entities open (please refer to [TR-03109-3] for more  
517           details) and to offer a so called wake-up service.

518           The Gateway is able to receive a wake-up message that is signed by the Gateway  
519           Administrator. The following steps are taken:

- 520           1. The Gateway verifies the wake-up packet. This comprises
- 521                 i. a check if the header identification is correct,
  - 522                 ii. the recipient is the Gateway,
  - 523                 iii. the wake-up packet has been sent/received within an acceptable period of  
524                     time in order to prevent replayed messages,
  - 525                 iv. the wake-up message has not been received before,
- 526           2. If the wake-up message could not be verified as described in step #1, the message  
527           will be dropped/ignored. No further operations will be initiated and no feedback is  
528           provided.
- 529           3. If the message could be verified as described in step #1, the signature of the wake-up  
530           message will be verified. The Gateway uses the services of its Security Module for  
531           signature verification.

---

<sup>19</sup> Please note that this does not affect the functionality for a CLS to establish a secure channel to a party in the WAN. Technically however, this channel is established by the TOE who acts as a proxy between the CLS and the WAN.

---

- 
- 532                   4. If the signature of the wake-up message cannot be verified as described in step #3  
533                   the message will be dropped/ignored. No feedback is given to the sending external  
534                   entity and the wake-up sequence terminates.
- 535                   5. If the signature of the wake-up message could be verified successfully , the Gateway  
536                   initiates a connection to a pre-configured external entity; however no feedback is  
537                   given to the sending external entity.

538                   More details on the exact implementation of this mechanism can be found in [TR-03109-1,  
539                   „Wake-Up Service“].

#### 540                   **1.4.5.6 Privacy Preservation**

541                   The preservation of the privacy of the consumer is an essential aspect that is implemented by  
542                   the functionality of the TOE as required by this ST.

543                   This contains two aspects:

544                   The Processing Profiles that the TOE obeys facilitate an approach in which only a minimum  
545                   amount of data have to be submitted to external entities and therewith leave the scope of  
546                   control of the consumer. The mechanisms “encryption” and “pseudonymisation” ensure that  
547                   the data can only be read by the intended recipient and only contains an association with the  
548                   identity of the Meter if this is necessary.

549                   On the other hand, the TOE provides the consumer with transparent information about the  
550                   information flows that happen with their data. In order to achieve this, the TOE implements a  
551                   consumer log that specifically contains the information about the information flows which  
552                   has been and will be authorised based on the previous and current Processing Profiles. The  
553                   access to this consumer log is only possible via a local interface from the HAN and after  
554                   authentication of the consumer. The TOE does only allow a consumer access to the data in  
555                   the consumer log that is related to their own consumption or production. The following  
556                   paragraphs provide more details on the information that is included in this log:

---

557           **Monitoring of Data Transfers**

558           The TOE keeps track of each data transmission in the consumer log and allows the consumer  
559           to see details on which information have been and will be sent (based on the previous and  
560           current settings) to which external entity.

561           **Configuration Reporting**

562           The TOE provides detailed and complete reporting in the consumer log of each security and  
563           privacy-relevant configuration setting. Additional to device specific configuration settings,  
564           the consumer log contains the parameters of each Processing Profile. The consumer log  
565           contains the configured addresses for internal and external entities including the CLS.

566           **Audit Log and Monitoring**

567           The TOE provides all audit data from the consumer log at the user interface IF\_GW\_CON.  
568           Access to the consumer log is only possible after successful authentication and only to  
569           information that the consumer has permission to (i.e. that has been recorded based on  
570           events belonging to the consumer).

571           **1.4.5.7 Management of Security Functions**

572           The Gateway provides authorised Gateway Administrators with functionality to manage the  
573           behaviour of the security functions and to update the TOE.

574           Further, it is defined that only authorised Gateway Administrators may be able to use the  
575           management functionality of the Gateway (while the Security Module is used for the  
576           authentication of the Gateway Administrator) and that the management of the Gateway  
577           shall only be possible from the WAN side interface.

578           **System Status**

579           The TOE provides information on the current status of the TOE in the system log. Specifically  
580           it shall indicate whether the TOE operates normally or any errors have been detected that  
581           are of relevance for the administrator.

#### 582 **1.4.5.8 Identification and Authentication**

583 To protect the TSF as well as User Data and TSF data from unauthorized modification the TOE  
 584 provides a mechanism that requires each user to be successfully identified and authenticated  
 585 before allowing any other actions on behalf of that user. This functionality includes the  
 586 identification and authentication of users who receive data from the Gateway as well as the  
 587 identification and authentication of CLS located in HAN and Meters located in LMN.

588 The Gateway provides different kinds of identification and authentication mechanisms that  
 589 depend on the user role and the used interfaces. Most of the mechanisms require the usage  
 590 of certificates. Only consumers are able to decide whether they use certificates or username  
 591 and password for identification and authentication.

#### 592 **1.4.6 The logical interfaces of the TOE**

593 The TOE offers its functionality as outlined before via a set of external interfaces. Figure 2  
 594 also indicates the cardinality of the interfaces. The following table provides an overview of  
 595 the mandatory external interfaces of the TOE and provides additional information:

Interface Name	Description
IF_GW_CON	Via this interface the Gateway provides the consumer <sup>20</sup> with the possibility to review information that is relevant for billing or the privacy of the consumer. Specifically the access to the consumer log is only allowed via this interface.
IF_GW_MTR	Interface between the Meter and the Gateway. The Gateway receives Meter Data via this interface. <sup>21</sup>
IF_GW_SM	The Gateway invokes the services of its Security Module via this interface.
IF_GW_CLS	CLS may use the communication services of the Gateway via this interface. The implementation of at least one interface for CLS is mandatory.
IF_GW_WAN	The Gateway submits information to authorised external entities via this interface.
IF_GW_SRV	Local interface via which the service technician has the possibility to review information that are relevant to maintain the Gateway. Specifically he has read

<sup>20</sup> Please note that this interface allows consumer (or consumer's CLS) to connect to the gateway in order to read consumer specific information.

<sup>21</sup> Please note that an implementation of this external interface is also required in the case that Meter and Gateway are implemented within one physical device in order to allow the extension of the system by another Meter.

	access to the system log only via this interface. He has also the possibility to view non-TSF data via this interface.
--	------------------------------------------------------------------------------------------------------------------------

596 **Table 3: Mandatory TOE external interfaces**

597 **1.4.7 The cryptography of the TOE and its Security Module**

598 Parts of the cryptographic functionality used in the upper mentioned functions is provided by  
 599 a Security Module. The Security Module provides strong cryptographic functionality, random  
 600 number generation, secure storage of secrets and supports the authentication of the  
 601 Gateway Administrator. The Security Module is a different IT product and not part of the TOE  
 602 as described in this ST. Nevertheless, it is physically embedded into the Gateway and  
 603 protected by the same level of physical protection. The requirements applicable to the  
 604 Security Module are specified in a separate PP (see [SecModPP]).

605 The following table provides a more detailed overview on how the cryptographic functions  
 606 are distributed between the TOE and its Security Module.

607

Aspect	TOE	Security Module
Communication with external entities	<ul style="list-style-type: none"> <li>• encryption</li> <li>• decryption</li> <li>• hashing</li> <li>• key derivation</li> <li>• MAC generation</li> <li>• MAC verification</li> <li>• secure storage of the TLS certificates</li> </ul>	Key negotiation: <ul style="list-style-type: none"> <li>• support of the authentication of the external entity</li> <li>• secure storage of the private key</li> <li>• random number generation</li> <li>• digital signature verification and generation</li> </ul>
Communication with the consumer	<ul style="list-style-type: none"> <li>• encryption</li> <li>• decryption</li> <li>• hashing</li> <li>• key derivation</li> <li>• MAC generation</li> <li>• MAC verification</li> <li>• secure storage of the TLS certificates</li> </ul>	Key negotiation: <ul style="list-style-type: none"> <li>• support of the authentication of the consumer</li> <li>• secure storage of the private key</li> <li>• digital signature verification and generation</li> <li>• random number generation</li> </ul>
Communication with the Meter	<ul style="list-style-type: none"> <li>• encryption</li> <li>• decryption</li> <li>• hashing</li> <li>• key derivation</li> <li>• MAC generation</li> <li>• MAC verification</li> <li>• secure storage of the TLS certificates</li> </ul>	Key negotiation (in case of TLS connection): <ul style="list-style-type: none"> <li>• support of the authentication of the meter</li> <li>• secure storage of the private key</li> <li>• digital signature verification and generation</li> <li>• random number generation</li> </ul>
Signing data before submission to an external entity	<ul style="list-style-type: none"> <li>• hashing</li> </ul>	Signature creation <ul style="list-style-type: none"> <li>• secure storage of the private key</li> </ul>
Content data encryption and integrity protection	<ul style="list-style-type: none"> <li>• encryption</li> <li>• decryption</li> <li>• MAC generation</li> <li>• key derivation</li> <li>• secure storage of the public Key</li> </ul>	Key negotiation: <ul style="list-style-type: none"> <li>• secure storage of the private key</li> <li>• random number generation</li> </ul>

**Table 4: Cryptographic support of the TOE and its Security Module**

608

609

---

610 **1.4.7.1 Content data encryption vs. an encrypted channel**

611 The TOE utilises concepts of the encryption of data on the content level as well as the  
612 establishment of a trusted channel to external entities.

613 As a general rule, all processed Meter Data that is prepared to be submitted to external  
614 entities is encrypted and integrity protected on a content level using CMS (according to  
615 [TR-03109-1-I]).

616 Further, all communication with external entities is enforced to happen via encrypted,  
617 integrity protected and mutually authenticated channels.

618 This concept of encryption on two layers facilitates use cases in which the external party  
619 that the TOE communicates with is not the final recipient of the Meter Data. In this way,  
620 it is for example possible that the Gateway Administrator receives Meter Data that they  
621 forward to other parties. In such a case, the Gateway Administrator is the endpoint of  
622 the trusted channel but cannot read the Meter Data.

623 Administration data that is transmitted between the Gateway Administrator and the TOE is  
624 also encrypted and integrity protected using CMS.

625 The following figure introduces the communication process between the Meter, the TOE and  
626 external entities (focussing on billing-relevant Meter Data).

627 The basic information flow for Meter Data is as follows and shown in Figure 5:

- 628 1. The Meter measures the consumption or production of a certain commodity.
- 629 2. The Meter Data is prepared for transmission:
  - 630 a. The Meter Data is typically signed (typically using the services of an integrated  
631 Security Module).
  - 632 b. If the communication between the Meter and the Gateway is performed  
633 bidirectional, the Meter Data is transmitted via an encrypted and mutually  
634 authenticated channel to the Gateway. Please note that the submission of this  
635 information may be triggered by the Meter or the Gateway.

636 or

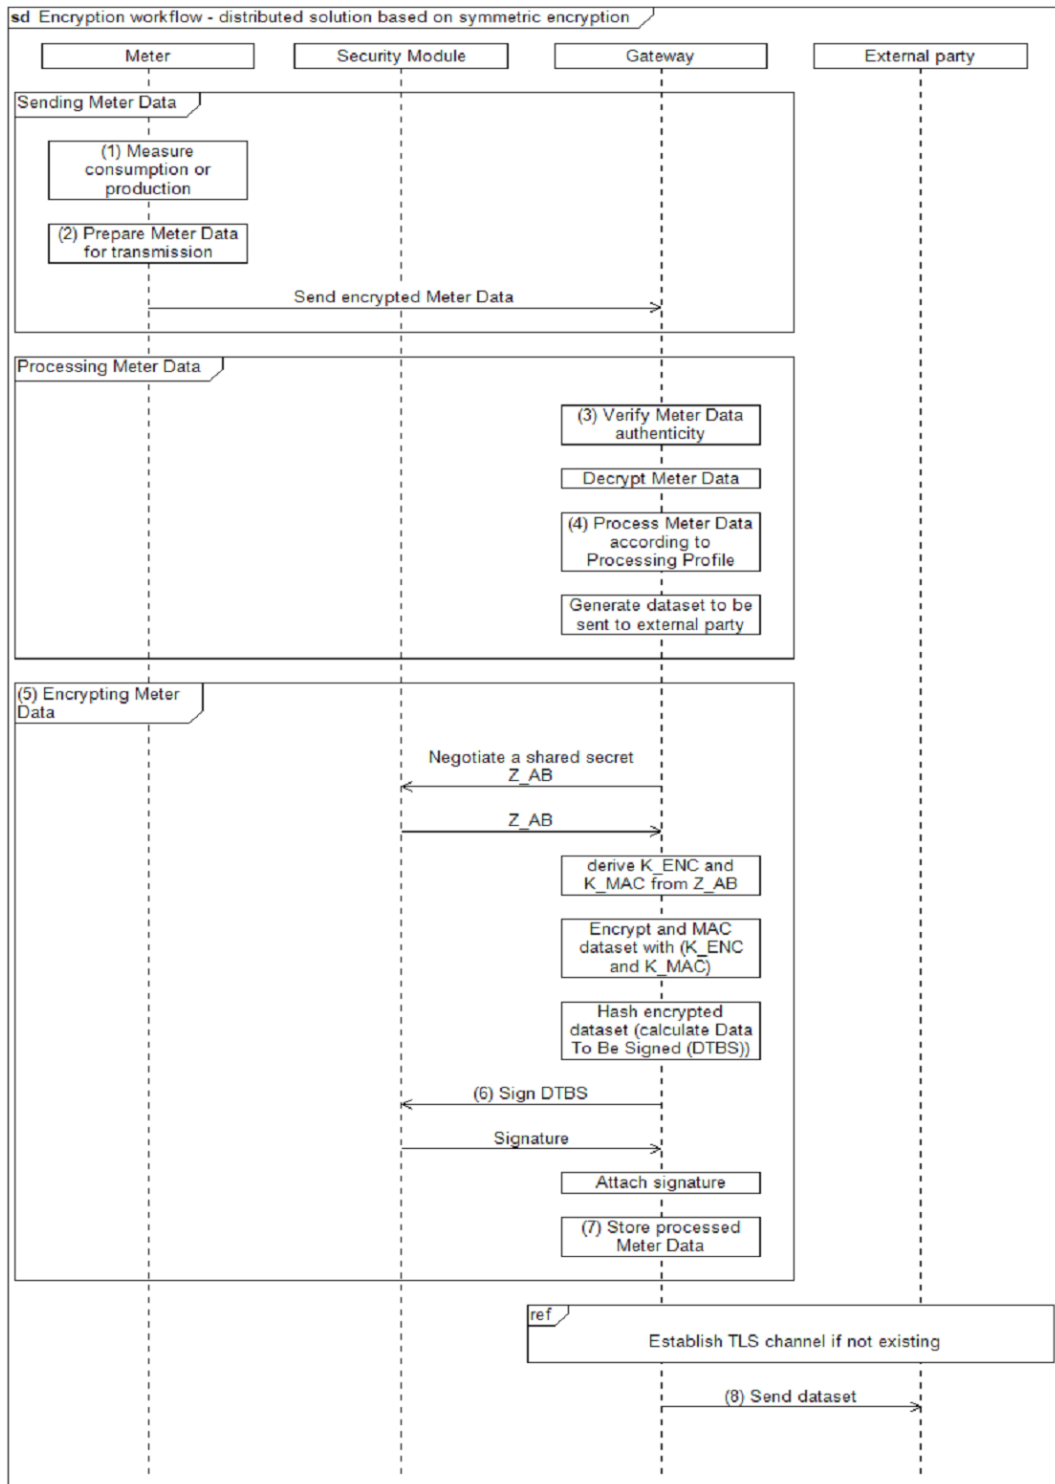

- 
- 637                   c. If a unidirectional communication is performed between the Meter and the  
638                   Gateway, the Meter Data is encrypted using a symmetric algorithm (according to  
639                   [TR-03109-3]) and facilitating a defined data structure to ensure the authenticity  
640                   and confidentiality.
- 641                   3. The authenticity and integrity of the Meter Data is verified by the Gateway.
- 642                   4. If (and only if) authenticity and integrity have been verified successfully, the Meter  
643                   Data is further processed by the Gateway according to the rules in the Processing  
644                   Profile else the cryptographic information flow will be cancelled.
- 645                   5. The processed Meter Data is encrypted and integrity protected using CMS (according  
646                   to [TR-03109-1-I]) for the final recipient of the data<sup>22</sup>.
- 647                   6. The processed Meter Data is signed using the services of the Security Module.
- 648                   7. The processed and signed Meter Data may be stored for a certain amount of time.
- 649                   8. The processed Meter Data is finally submitted to an authorised external entity in the  
650                   WAN via an encrypted and mutually authenticated channel.

---

<sup>22</sup> Optionally the Meter Data can additionally be signed before any encryption is done.

651

652

Figure 5: Cryptographic information flow for distributed Meters and Gateway

---

653        **1.4.8 TOE life-cycle**

654        The life-cycle of the TOE can be separated into the following phases:

- 655            1. Development
- 656            2. Production
- 657            3. Pre-personalization at the developer's premises (without Security Module)
- 658            4. Pre-personalization and integration of Security Module
- 659            5. Installation and start of operation
- 660            6. Personalization
- 661            7. Normal operation

662        A detailed description of the phases #1 to #4 and #6 to #7 is provided in [TR-03109-1-VI],

663        while phase #5 is described in the TOE manuals.

664        The TOE will be delivered after phase “Pre-personalization and integration of Security

665        Module”. The phase “Personalization” will be performed when the TOE is started for the first

666        time after phase “Installation and start of operation”. The TOE delivery process is specified in

667        [AGD\_SEC].

---

668 **2 Conformance Claims**

669 **2.1 CC Conformance Claim**

- 670
- 671 • This ST has been developed using Version 3.1 Revision 5 of Common Criteria [CC].
  - 672 • This ST is [CC] part 2 extended due to the use of FPR\_CON.1.
  - 673 • This ST claims conformance to [CC] part 3; no extended assurance components have  
674 been defined.

675 **2.2 PP Claim / Conformance Statement**

676 This Security Target claims strict conformance to Protection Profile [PP\_GW].

677

678 **2.3 Package Claim**

679 This Security Target claims an assurance package EAL4 augmented by AVA\_VAN.5 and  
680 ALC\_FLR.2 as defined in [CC] Part 3 for product certification.

681

682 **2.4 Conformance Claim Rationale**

683 This Security Target claims strict conformance to only one PP [PP\_GW].

684 This Security Target is consistent to the TOE type according to [PP\_GW] because the TOE is a  
685 communication Gateway that provides different external communication interfaces and  
686 enables the data communication between these interfaces and connected IT systems. It  
687 further collects processes, and stores Meter Data.

688 This Security Target is consistent to the security problem defined in [PP\_GW].

689 This Security Target is consistent to the security objectives stated in [PP\_GW], no security  
690 objective of the PP is removed, nor added to this Security Target.

691 This Security Target is consistent to the security requirements stated in [PP\_GW], no security  
692 requirement of the PP is removed, nor added to this Security Target.

693

## 694 3 Security Problem Definition

### 695 3.1 External entities

696 The following external entities interact with the system consisting of Meter and Gateway.  
 697 Those roles have been defined for the use in this Security Target. It is possible that a party  
 698 implements more than one role in practice.

Role	Description
Consumer	The authorised individual or organization that “owns” the Meter Data. In most cases, this will be tenants or house owners consuming electricity, water, gas or further commodities. However, it is also possible that the consumer produces or stores energy (e.g. with their own solar plant).
Gateway Administrator	Authority that installs, configures, monitors, and controls the Smart Meter Gateway.
Service Technician	The authorised individual that is responsible for diagnostic purposes.
Authorised External Entity / User	Human or IT entity possibly interacting with the TOE from outside of the TOE boundary. In the context of this ST, the term <i>user</i> or <i>external entity</i> serve as a hypernym for all entities mentioned before.

699 **Table 5: Roles used in the Security Target**

### 700 3.2 Assets

701 The following tables introduces the relevant assets for this Security Target. The tables focus  
 702 on the assets that are relevant for the Gateway and does not claim to provide an overview  
 703 over all assets in the Smart Metering System or for other devices in the LMN.

704 The following Table 6 lists all assets typified as “user data”:  
 705

Asset	Description	Need for Protection
Meter Data	Meter readings that allow calculation of the quantity of a commodity, e.g. electricity, gas, water or heat consumed over a period. Meter Data comprise Consumption or Production Data (billing-relevant) and grid status data (not billing-relevant). While billing-relevant data needs to have a relation to the Consumer, grid status data do not have to be directly related to a Consumer.	<ul style="list-style-type: none"> <li>According to their specific need (see below)</li> </ul>
System log data	Log data from the <ul style="list-style-type: none"> <li>system log.</li> </ul>	<ul style="list-style-type: none"> <li>Integrity</li> <li>Confidentiality (only authorised SMGW administrators and Service technicians may read the log data)</li> </ul>
Consumer log data	Log data from the <ul style="list-style-type: none"> <li>consumer log.</li> </ul>	<ul style="list-style-type: none"> <li>Integrity</li> <li>Confidentiality (only authorised Consumers may read the log data)</li> </ul>
Calibration log data	Log data from the <ul style="list-style-type: none"> <li>calibration log.</li> </ul>	<ul style="list-style-type: none"> <li>Integrity</li> <li>Confidentiality (only authorised SMGW administrators may read the log data)</li> </ul>
Consumption Data	Billing-relevant part of Meter Data. Please note that the term <i>Consumption Data</i> implicitly includes Production Data.	<ul style="list-style-type: none"> <li>Integrity and authenticity (comparable to the classical meter and its security requirements)</li> <li>Confidentiality (due to privacy concerns)</li> </ul>
Status Data	Grid status data, subset of Meter Data that is not billing-relevant <sup>23</sup> .	<ul style="list-style-type: none"> <li>Integrity and authenticity (comparable to the classical meter and its security requirements)</li> <li>Confidentiality (due to privacy concerns)</li> </ul>

<sup>23</sup> Please note that these readings and data of the Meter which are not relevant for billing may require an explicit endorsement of the consumer(s).

Supplementary Data	The Gateway may be used for communication purposes by devices in the LMN or HAN. It may be that the functionality of the Gateway that is used by such a device is limited to pure (but secure) communication services. Data that is transmitted via the Gateway but that does not belong to one of the aforementioned data types is named <i>Supplementary Data</i> .	<ul style="list-style-type: none"> <li>• According to their specific need</li> </ul>
Data	The term <i>Data</i> is used as hypernym for <i>Meter Data and Supplementary Data</i> .	<ul style="list-style-type: none"> <li>• According to their specific need</li> </ul>
Gateway time	Date and time of the real-time clock of the Gateway. Gateway Time is used in Meter Data records sent to external entities.	<ul style="list-style-type: none"> <li>• Integrity</li> <li>• Authenticity (when time is adjusted to an external reference time)</li> </ul>
Personally Identifiable Information (PII)	Personally Identifiable Information refers to information that can be used to uniquely identify, contact, or locate a single person or can be used with other sources to uniquely identify a single individual.	<ul style="list-style-type: none"> <li>• Confidentiality</li> </ul>

706

**Table 6: Assets (User data)**

707 Table 7 lists all assets typified as “TSF data”:

Meter config (secondary asset)	Configuration data of the Meter to control its behaviour including the Meter identity. Configuration data is transmitted to the Meter via the Gateway.	<ul style="list-style-type: none"> <li>• Integrity and authenticity</li> <li>• Confidentiality</li> </ul>
Gateway config (secondary asset)	Configuration data of the Gateway to control its behaviour including the Gateway identity, the Processing Profiles and certificate/key material for authentication.	<ul style="list-style-type: none"> <li>• Integrity and authenticity</li> <li>• Confidentiality</li> </ul>
CLS config (secondary asset)	Configuration data of a CLS to control its behaviour. Configuration data is transmitted to the CLS via the Gateway.	<ul style="list-style-type: none"> <li>• Integrity and authenticity</li> <li>• Confidentiality</li> </ul>
Firmware update (secondary asset)	Firmware update that is downloaded by the TOE to update the firmware of the TOE.	<ul style="list-style-type: none"> <li>• Integrity and authenticity</li> </ul>

Ephemeral keys (secondary asset)	Ephemeral cryptographic material used by the TOE for cryptographic operations.	<ul style="list-style-type: none"> <li>• Integrity and authenticity</li> <li>• Confidentiality</li> </ul>
----------------------------------	--------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------

708

**Table 7: Assets (TSF data)**

709

### 710 3.3 Assumptions

711 In this threat model the following assumptions about the environment of the components  
712 need to be taken into account in order to ensure a secure operation.

713 **A.ExternalPrivacy** It is assumed that authorised and authenticated external  
714 entities receiving any kind of privacy-relevant data or billing-  
715 relevant data and the applications that they operate are  
716 trustworthy (in the context of the data that they receive) and  
717 do not perform unauthorised analyses of this data with  
718 respect to the corresponding Consumer(s).

719 **A.TrustedAdmins** It is assumed that the Gateway Administrator and the Service  
720 Technician are trustworthy and well-trained.

721 **A.PhysicalProtection** It is assumed that the TOE is installed in a non-public  
722 environment within the premises of the Consumer which  
723 provides a basic level of physical protection. This protection  
724 covers the TOE, the Meter(s) that the TOE communicates  
725 with and the communication channel between the TOE and  
726 its Security Module.

727 **A.ProcessProfile** The Processing Profiles that are used when handling data are  
728 assumed to be trustworthy and correct.

729 **A.Update** It is assumed that firmware updates for the Gateway that can  
730 be provided by an authorised external entity have undergone

731 a certification process according to this Security Target  
 732 before they are issued and can therefore be assumed to be  
 733 correctly implemented. It is further assumed that the  
 734 external entity that is authorised to provide the update is  
 735 trustworthy and will not introduce any malware into a  
 736 firmware update.

737 **A.Network**

It is assumed that

- 738 • a WAN network connection with a sufficient reliability  
 739 and bandwidth for the individual situation is available,
- 740 • one or more trustworthy sources for an update of the  
 741 system time are available in the WAN,
- 742 • the Gateway is the only communication gateway for  
 743 Meters in the LMN<sup>24</sup>,
- 744 • if devices in the HAN have a separate connection to  
 745 parties in the WAN (beside the Gateway) this connection  
 746 is appropriately protected.

747 **A.Keygen**

It is assumed that the ECC key pair for a Meter (TLS) is  
 748 generated securely according to [TR-03109-3] and brought  
 749 into the Gateway in a secure way by the Gateway  
 750 Administrator.

751 **Application Note 1:**

This ST acknowledges that the Gateway cannot be completely  
 752 protected against unauthorised physical access by its  
 753 environment. However, it is important for the overall security  
 754 of the TOE that it is not installed within a public environment.  
 755 The level of physical protection that is expected to be  
 756 provided by the environment is the same level of protection  
 757 that is expected for classical meters that operate according to

---

<sup>24</sup> Please note that this assumption holds on a logical level rather than on a physical one. It may be possible that the Meters in the LMN have a physical connection to other devices that would in theory also allow a communication. This is specifically true for wireless communication technologies. It is further possible that signals of Meters are amplified by other devices or other Meters on the physical level without violating this assumption. However, it is assumed that the Meters do only communicate with the TOE and that only the TOE is able to decrypt the data sent by the Meter.

---

758 the regulations of the national calibration authority [TR-  
759 03109-1].

760 **Application Note 2:** The Processing Profiles that are used for information flow  
761 control as referred to by A.ProcessProfile are an essential  
762 factor for the preservation of the privacy of the Consumer.  
763 The Processing Profiles are used to determine which data  
764 shall be sent to which entity at which frequency and how  
765 data are processed, e.g. whether the data needs to be related  
766 to the Consumer (because it is used for billing purposes) or  
767 whether the data shall be pseudonymised.  
768 The Processing Profiles shall be visible for the Consumer to  
769 allow a transparent communication.  
770 It is essential that Processing Profiles correctly define the  
771 amount of information that must be sent to an external  
772 entity. Exact regulations regarding the Processing Profiles and  
773 the Gateway Administrator are beyond the scope of this  
774 Security Target.  
775

### 776 3.4 Threats

777 The following sections identify the threats that are posed against the assets handled by the  
778 Smart Meter System. Those threats are the result of a threat model that has been developed  
779 for the whole Smart Metering System first and then has been focussed on the threats against  
780 the Gateway. It should be noted that the threats in the following paragraphs consider two  
781 different kinds of attackers:

- 782 • Attackers having physical access to Meter, Gateway, a connection between these  
783 components or local logical access to any of the interfaces (local attacker), trying to  
784 disclose or alter assets while stored in the Gateway or while transmitted between Meters  
785 in the LMN and the Gateway. Please note that the following threat model assumes that  
786 the local attacker has less motivation than the WAN attacker as a successful attack of a  
787 local attacker will always only impact one Gateway. Please further note that the local  
788 attacker includes authorised individuals like consumers.
- 789 • An attacker located in the WAN (WAN attacker) trying to compromise the confidentiality  
790 and/or integrity of the processed Meter Data and or configuration data transmitted via

791 the WAN, or attacker trying to conquer a component of the infrastructure (i.e. Meter,  
792 Gateway or Controllable Local System) via the WAN to cause damage to a component  
793 itself or to the corresponding grid (e.g. by sending forged Meter Data to an external  
794 entity).

795 The specific rationale for this situation is given by the expected benefit of a successful attack.  
796 An attacker who has to have physical access to the TOE that they are attacking, will only be  
797 able to compromise one TOE at a time. So the effect of a successful attack will always be  
798 limited to the attacked TOE. A logical attack from the WAN side on the other hand may have  
799 the potential to compromise a large amount of TOEs.

800

801 **T.DataModificationLocal** A local attacker may try to modify (i.e. alter, delete, insert,  
802 replay or redirect) Meter Data when transmitted between  
803 Meter and Gateway, Gateway and Consumer, or Gateway  
804 and external entities. The objective of the attacker may be to  
805 alter billing-relevant information or grid status information.  
806 The attacker may perform the attack via any interface (LMN,  
807 HAN, or WAN).  
808 In order to achieve the modification, the attacker may also  
809 try to modify secondary assets like the firmware or  
810 configuration parameters of the Gateway.

811 **T.DataModificationWAN** A WAN attacker may try to modify (i.e. alter, delete, insert,  
812 replay or redirect) Meter Data, Gateway config data, Meter  
813 config data, CLS config data or a firmware update when  
814 transmitted between the Gateway and an external entity in  
815 the WAN.  
816 When trying to modify Meter Data, it is the objective of the  
817 WAN attacker to modify billing-relevant information or grid  
818 status data.

---

819		When trying to modify config data or a firmware update, the
820		WAN attacker tries to circumvent security mechanisms of the
821		TOE or tries to get control over the TOE or a device in the LAN
822		that is protected by the TOE.
823	<b>T.TimeModification</b>	A local attacker or WAN attacker may try to alter the
824		Gateway time. The motivation of the attacker could be e.g. to
825		change the relation between date/time and measured
826		consumption or production values in the Meter Data records
827		(e.g. to influence the balance of the next invoice).
828	<b>T.DisclosureWAN</b>	A WAN attacker may try to violate the privacy of the
829		Consumer by disclosing Meter Data or configuration data
830		(Meter config, Gateway config or CLS config) or parts of it
831		when transmitted between Gateway and external entities in
832		the WAN.
833	<b>T.DisclosureLocal</b>	A local attacker may try to violate the privacy of the
834		Consumer by disclosing Meter Data transmitted between the
835		TOE and the Meter. This threat is of specific importance if
836		Meters of more than one Consumer are served by one
837		Gateway.
838	<b>T.Infrastructure</b>	A WAN attacker may try to obtain control over Gateways,
839		Meters or CLS via the TOE, which enables the WAN attacker
840		to cause damage to Consumers or external entities or the
841		grids used for commodity distribution (e.g. by sending wrong
842		data to an external entity).
843		A WAN attacker may also try to conquer a CLS in the HAN
844		first in order to logically attack the TOE from the HAN side.
845	<b>T.ResidualData</b>	By physical and/or logical means a local attacker or a WAN
846		attacker may try to read out data from the Gateway, which

---

847 travelled through the Gateway before and which are no  
848 longer needed by the Gateway (i.e. Meter Data, Meter config,  
849 or CLS config).

850 **T.ResidentData** A WAN or local attacker may try to access (i.e. read, alter,  
851 delete) information to which they don't have permission to  
852 while the information is stored in the TOE.

853 While the WAN attacker only uses the logical interface of the  
854 TOE that is provided into the WAN, the local attacker may  
855 also physically access the TOE.

856 **T.Privacy** A WAN attacker may try to obtain more detailed information  
857 from the Gateway than actually required to fulfil the tasks  
858 defined by its role or the contract with the Consumer. This  
859 includes scenarios in which an external entity that is primarily  
860 authorised to obtain information from the TOE tries to obtain  
861 more information than the information that has been  
862 authorised as well as scenarios in which an attacker who is  
863 not authorised at all tries to obtain information.

### 864 **3.5 Organizational Security Policies**

865 This section lists the organizational security policies (OSP) that the Gateway shall comply  
866 with:

867 **OSP.SM** The TOE shall use the services of a certified Security Module  
868 for

- 869 • verification of digital signatures,
- 870 • generation of digital signatures,
- 871 • key agreement,
- 872 • key transport,
- 873 • key storage,

901

**OSP.Log**

- Random Number Generation,

The Security Module shall be certified according to [SecModPP] and shall be used in accordance with its relevant guidance documentation.

The TOE shall maintain a set of log files as defined in [TR-03109-1] as follows:

1. A system log of relevant events in order to allow an authorised Gateway Administrator to analyse the status of the TOE. The TOE shall also analyse the system log automatically for a cumulation of security relevant events.
2. A consumer log that contains information about the information flows that have been initiated to the WAN and information about the Processing Profiles causing this information flow as well as the billing-relevant information.
3. A calibration log (as defined in chapter 6.2.1) that provides the Gateway Administrator with a possibility to review calibration relevant events.

The TOE shall further limit access to the information in the different log files as follows:

1. Access to the information in the system log shall only be allowed for an authorised Gateway Administrator via the IF\_GW\_WAN interface of the TOE and an authorised Service Technician via the IF\_GW\_SRV interface of the TOE.
2. Access to the information in the calibration log shall only be allowed for an authorised Gateway

---

902 Administrator via the IF\_GW\_WAN interface of the  
903 TOE.

904 3. Access to the information in the consumer log shall  
905 only be allowed for an authorised Consumer via the  
906 IF\_GW\_CON interface of the TOE. The Consumer  
907 shall only have access to their own information.

908 The system log may overwrite the oldest events in case that  
909 the audit trail gets full.

910 For the consumer log the TOE shall ensure that a sufficient  
911 amount of events is available (in order to allow a Consumer  
912 to verify an invoice) but may overwrite older events in case  
913 that the audit trail gets full.

914 For the calibration log, however, the TOE shall ensure the  
915 availability of all events over the lifetime of the TOE.

---

916           **4 Security Objectives**

917           **4.1 Security Objectives for the TOE**

918           **O.Firewall**

The TOE shall serve as the connection point for the connected devices within the LAN to external entities within the WAN and shall provide firewall functionality in order to protect the devices of the LMN and HAN (as long as they use the Gateway) and itself against threats from the WAN side.

The firewall:

- shall allow only connections established from HAN or the TOE itself to the WAN (i.e. from devices in the HAN to external entities in the WAN or from the TOE itself to external entities in the WAN),
- shall provide a wake-up service on the WAN side interface,
- shall not allow connections from the LMN to the WAN,
- shall not allow any other services being offered on the WAN side interface,
- shall not allow connections from the WAN to the LAN or to the TOE itself,
- shall enforce communication flows by allowing traffic from CLS in the HAN to the WAN only if confidentiality-protected and integrity-protected and if endpoints are authenticated.

940           **O.SeparateIF**

The TOE shall have physically separated ports for the LMN, the HAN and the WAN and shall automatically detect during

942 its self test whether connections (wired or wireless), if any,  
943 are wrongly connected.

944 **Application Note 3:** O.SeparateIF refers to physical interfaces  
945 and must not be fulfilled by a pure logical separation of one  
946 physical interface only.

947 **O.Conceal** To protect the privacy of its Consumers, the TOE shall conceal  
948 the communication with external entities in the WAN in  
949 order to ensure that no privacy-relevant information may be  
950 obtained by analysing the frequency, load, size or the  
951 absence of external communication.<sup>25</sup>

952 **O.Meter** The TOE receives or polls information about the consumption  
953 or production of different commodities from one or multiple  
954 Meters and is responsible for handling this Meter Data.

This includes that:

- The TOE shall ensure that the communication to the Meter(s) is established in an Gateway Administrator-definable interval or an interval as defined by the Meter,
- the TOE shall enforce encryption and integrity protection for the communication with the Meter<sup>26</sup>,
- the TOE shall verify the integrity and authenticity of the data received from a Meter before handling it further,

---

25 It should be noted that this requirement only applies to communication flows in the WAN.

26 It is acknowledged that the implementation of a secure channel between the Meter and the Gateway is a security function of both units. The TOE as defined in this Security Target only has a limited possibility to secure this communication as both sides have to sign responsible for the quality of a cryptographic connection. However, it should be noted that the encryption of this channel only needs to protect against the Local Attacker possessing a basic attack potential and that the Meter utilises the services of its Security Module to negotiate the channel.

---

- 974
- 975
- 976
- 977
- 978
- the TOE shall process the data according to the definition in the corresponding Processing Profile,
  - the TOE shall encrypt the processed Meter Data for the final recipient, sign the data and
  - deliver the encrypted data to authorised external entities as defined in the corresponding Processing Profiles facilitating an encrypted channel,
  - the TOE shall store processed Meter Data if an external entity cannot be reached and re-try to send the data until a configurable number of unsuccessful retries has been reached,
  - the TOE shall pseudonymize the data for parties that do not need the relation between the processed Meter Data and the identity of the Consumer.

979 **O.Crypt**

The TOE shall provide cryptographic functionality as follows:

- 980
- 981
- 982
- 983
- 984
- 985
- 986
- 987
- 988
- 989
- 990
- authentication, integrity protection and encryption of the communication and data to external entities in the WAN,
  - authentication, integrity protection and encryption of the communication to the Meter,
  - authentication, integrity protection and encryption of the communication to the Consumer,
  - replay detection for all communications with external entities,
  - encryption of the persistently stored TSF and user data of the TOE<sup>27</sup>.

---

<sup>27</sup> The encryption of the persistent memory shall support the protection of the TOE against local attacks.

991 In addition, the TOE shall generate the required keys utilising  
 992 the services of its Security Module<sup>28</sup>, ensure that the keys are  
 993 only used for an acceptable amount of time and destroy  
 994 ephemeral<sup>29</sup> keys if not longer needed.<sup>30</sup>

995 **O.Time** The TOE shall provide reliable time stamps and update its  
 996 internal clock in regular intervals by retrieving reliable time  
 997 information from a dedicated reliable source in the WAN.

998 **O.Protect** The TOE shall implement functionality to protect its security  
 999 functions against malfunctions and tampering.

1000 Specifically, the TOE shall

- 1001 • encrypt its TSF and user data as long as it is not in
- 1002 use,
- 1003 • overwrite any information that is no longer needed
- 1004 to ensure that it is not longer available via the
- 1005 external interfaces of the TOE<sup>31</sup>,
- 1006 • monitor user data and the TOE firmware for integrity
- 1007 errors,
- 1008 • contain a test that detects whether the interfaces for
- 1009 WAN and LAN are separate,
- 1010 • have a fail-safe design that specifically ensures that
- 1011 no malfunction can impact the delivery of a
- 1012 commodity (e.g. energy, gas, heat or water)<sup>32</sup>,

28 Please refer to chapter 1.4.7 for an overview on how the cryptographic functions are distributed between the TOE and its Security Module.

29 This objective addresses the destruction of ephemeral keys only because all keys that need to be stored persistently are stored in the Security Module.

30 Please refer to chapter F.9 of part 2 of [CC] for more detailed information about what kind of information this objective applies to.

31 Please refer to chapter F.9 of part 2 of [CC] for more detailed information about what kind of information this objective applies to.

32 Indeed this Security Target acknowledges that the Gateway and the Meters have no possibility at all to impact the delivery of a commodity. Even an intentional stop of the delivery of a certain commodity is not within the scope of this Security Target. It

- 1013
- 1014
- 1015
- make any physical manipulation within the scope of the intended environment detectable for the Consumer and Gateway Administrator.

1016 **O.Management**

1017 The TOE shall only provide authorised Gateway Administrators with functions for the management of the security features.

1018

1019 The TOE shall ensure that any change in the behaviour of the security functions can only be achieved from the WAN side interface. Any management activity from a local interface may only be read only.

1020

1021

1022

1023 Further, the TOE shall implement a secure mechanism to update the firmware of the TOE that ensures that only authorised entities are able to provide updates for the TOE and that only authentic and integrity protected updates are applied.

1028 **O.Log**

1029 The TOE shall maintain a set of log files as defined in [TR-03109-1] as follows:

- 1030
- 1031
- 1032
- 1033
- 1034
- 1035
- 1036
- 1037
- 1038
- 1039
1. A system log of relevant events in order to allow an authorised Gateway Administrator or an authorised Service Technician to analyse the status of the TOE. The TOE shall also analyse the system log automatically for a cumulation of security relevant events.
  2. A consumer log that contains information about the information flows that have been initiated to the WAN and information about the Processing Profiles causing this information flow as well as the billing-

---

should however be noted that such a functionality may be realised by a CLS that utilises the services of the TOE for its communication.

---

1040 relevant information and information about the  
1041 system status (including relevant error messages).

1042 3. A calibration log that provides the Gateway  
1043 Administrator with a possibility to review calibration  
1044 relevant events.

1045 The TOE shall further limit access to the information in the  
1046 different log files as follows:

1047 1. Access to the information in the system log shall only  
1048 be allowed for an authorised Gateway Administrator  
1049 via IF\_GW\_WAN or for an authorised Service  
1050 Technician via IF\_GW\_SRV.

1051 2. Access to the information in the consumer log shall  
1052 only be allowed for an authorised Consumer via the  
1053 IF\_GW\_CON interface of the TOE and via a secured  
1054 (i.e. confidentiality and integrity protected)  
1055 connection. The Consumer shall only have access to  
1056 their own information.

1057 3. Read-only access to the information in the calibration  
1058 log shall only be allowed for an authorised Gateway  
1059 Administrator via the WAN interface of the TOE.

1060 The system log may overwrite the oldest events in case that  
1061 the audit trail gets full.

1062 For the consumer log, the TOE shall ensure that a sufficient  
1063 amount of events is available (in order to allow a Consumer  
1064 to verify an invoice) but may overwrite older events in case  
1065 that the audit trail gets full.

1066 For the calibration log however, the TOE shall ensure the  
1067 availability of all events over the lifetime of the TOE.

1068           **O.Access**                                 The TOE shall control the access of external entities in WAN,  
 1069                                                         HAN or LMN to any information that is sent to, from or via  
 1070                                                         the TOE via its external interfaces<sup>33</sup>. Access control shall  
 1071                                                         depend on the destination interface that is used to send that  
 1072                                                         information.

## 1073           **4.2 Security Objectives for the Operational Environment**

1074           **OE.ExternalPrivacy**                    Authorised and authenticated external entities receiving any  
 1075                                                         kind of private or billing-relevant data shall be trustworthy  
 1076                                                         and shall not perform unauthorised analyses of these data  
 1077                                                         with respect to the corresponding consumer(s).

1078           **OE.TrustedAdmins**                    The Gateway Administrator and the Service Technician shall  
 1079                                                         be trustworthy and well-trained.

1080           **OE.PhysicalProtection**                 The TOE shall be installed in a non-public environment within  
 1081                                                         the premises of the Consumer that provides a basic level of  
 1082                                                         physical protection. This protection shall cover the TOE, the  
 1083                                                         Meters that the TOE communicates with and the  
 1084                                                         communication channel between the TOE and its Security  
 1085                                                         Module. Only authorised individuals may physically access  
 1086                                                         the TOE.

1087           **OE.Profile**                                 The Processing Profiles that are used when handling data  
 1088                                                         shall be obtained from a trustworthy and reliable source only.

1089           **OE.SM**                                         The environment shall provide the services of a certified  
 1090                                                         Security Module for  
 1091                                                                 • verification of digital signatures,

---

<sup>33</sup> While in classical access control mechanisms the Gateway Administrator gets complete access, the TOE also maintains a set of information (specifically the consumer log) to which Gateway Administrators have restricted access.

---

1092		<ul style="list-style-type: none"><li>• generation of digital signatures,</li></ul>
1093		<ul style="list-style-type: none"><li>• key agreement,</li></ul>
1094		<ul style="list-style-type: none"><li>• key transport,</li></ul>
1095		<ul style="list-style-type: none"><li>• key storage,</li></ul>
1096		<ul style="list-style-type: none"><li>• Random Number Generation.</li></ul>
1097		The Security Module used shall be certified according to
1098		[SecModPP] and shall be used in accordance with its relevant
1099		guidance documentation.
1100	<b>OE.Update</b>	The firmware updates for the Gateway that can be provided
1101		by an authorised external entity shall undergo a certification
1102		process according to this Security Target before they are
1103		issued to show that the update is implemented correctly. The
1104		external entity that is authorised to provide the update shall
1105		be trustworthy and ensure that no malware is introduced via
1106		a firmware update.
1107	<b>OE.Network</b>	It shall be ensured that
1108		<ul style="list-style-type: none"><li>• a WAN network connection with a sufficient</li></ul>
1109		reliability and bandwidth for the individual situation
1110		is available,
1111		<ul style="list-style-type: none"><li>• one or more trustworthy sources for an update of the</li></ul>
1112		system time are available in the WAN,
1113		<ul style="list-style-type: none"><li>• the Gateway is the only communication gateway for</li></ul>
1114		Meters in the LMN,
1115		<ul style="list-style-type: none"><li>• if devices in the HAN have a separate connection to</li></ul>
1116		parties in the WAN (beside the Gateway) this
1117		connection is appropriately protected.
1118	<b>OE.Keygen</b>	It shall be ensured that the ECC key pair for a Meter (TLS) is
1119		generated securely according to the [TR-03109-3]. It shall

---

1120 also be ensured that the keys are brought into the Gateway  
 1121 in a secure way by the Gateway Administrator.

1122 **4.3 Security Objective Rationale**

1123 **4.3.1 Overview**

1124 The following table gives an overview how the assumptions, threats, and organisational  
 1125 security policies are addressed by the security objectives. The text of the following sections  
 1126 justifies this more in detail.

	O.Firewall	O.SeparateIF	O.Conceal	O.Meter	O.Crypt	O.Time	O.Protect	O.Management	O.Log	O.Access	OE.SM	OE.ExternalPrivacy	OE.TrustedAdmins	OE.PhysicalProtection	OE.Profile	OE.Update	OE.Network	OE.Keygen

**Table 8: Rationale for Security Objectives**

1127

1128

1129 **4.3.2 Countering the threats**

1130 The following sections provide more detailed information on how the threats are countered  
 1131 by the security objectives for the TOE and its operational environment.

1132

1133 **4.3.2.1 General objectives**

1134 The security objectives **O.Protect**, **O.Management** and **OE.TrustedAdmins** contribute to  
 1135 counter each threat and contribute to each OSP.

1136 **O.Management** is indispensable as it defines the requirements around the management of  
 1137 the Security Functions. Without a secure management no TOE can be secure. Also  
 1138 **OE.TrustedAdmins** contributes to this aspect as it provides the requirements on the  
 1139 availability of a trustworthy Gateway Administrator and Service Technician. **O.Protect** is  
 1140 present to ensure that all security functions are working as specified.

1141 Those general objectives will not be addressed in detail in the following paragraphs.

1142

1143 **4.3.2.2 T.DataModificationLocal**

1144 The threat **T.DataModificationLocal** is countered by a combination of the security objectives  
 1145 **O.Meter**, **O.Crypt**, **O.Log** and **OE.PhysicalProtection**.

1146 **O.Meter** defines that the TOE will enforce the encryption of communication when receiving  
 1147 Meter Data from the Meter. **O.Crypt** defines the required cryptographic functionality. The

---

1148 objectives together ensure that the communication between the Meter and the TOE cannot  
1149 be modified or released.

1150 **OE.PhysicalProtection** is of relevance as it ensures that access to the TOE is limited.

#### 1151 **4.3.2.3 T.DataModificationWAN**

1152 The threat **T.DataModificationWAN** is countered by a combination of the security objectives  
1153 **O.Firewall** and **O.Crypt**.

1154 **O.Firewall** defines the connections for the devices within the LAN to external entities within  
1155 the WAN and shall provide firewall functionality in order to protect the devices of the LMN  
1156 and HAN (as long as they use the Gateway) and itself against threats from the WAN side.

1157 **O.Crypt** defines the required cryptographic functionality. Both objectives together ensure  
1158 that the data transmitted between the TOE and the WAN cannot be modified by a WAN  
1159 attacker.

#### 1160 **4.3.2.4 T.TimeModification**

1161 The threat **T.TimeModification** is countered by a combination of the security objectives  
1162 **O.Time**, **O.Crypt** and **OE.PhysicalProtection**.

1163 **O.Time** defines that the TOE needs a reliable time stamp mechanism that is also updated  
1164 from reliable sources regularly in the WAN. **O.Crypt** defines the required cryptographic  
1165 functionality for the communication to external entities in the WAN. Therewith, **O.Time** and  
1166 **O.Crypt** are the core objective to counter the threat **T.TimeModification**.

1167 **OE.PhysicalProtection** is of relevance as it ensures that access to the TOE is limited.

#### 1168 **4.3.2.5 T.DisclosureWAN**

1169 The threat **T.DisclosureWAN** is countered by a combination of the security objectives  
1170 **O.Firewall**, **O.Conceal** and **O.Crypt**.

---

1171 **O.Firewall** defines the connections for the devices within the LAN to external entities within  
1172 the WAN and shall provide firewall functionality in order to protect the devices of the LMN  
1173 and HAN (as long as they use the Gateway) and itself against threats from the WAN side.

1174 **O.Crypt** defines the required cryptographic functionality. Both objectives together ensure  
1175 that the communication between the Meter and the TOE cannot be disclosed.

1176 **O.Conceal** ensures that no information can be disclosed based on additional characteristics  
1177 of the communication like frequency, load or the absence of a communication.

#### 1178 **4.3.2.6 T.DisclosureLocal**

1179 The threat **T.DisclosureLocal** is countered by a combination of the security objectives  
1180 **O.Meter**, **O.Crypt** and **OE.PhysicalProtection**.

1181 **O.Meter** defines that the TOE will enforce the encryption and integrity protection of  
1182 communication when polling or receiving Meter Data from the Meter. **O.Crypt** defines the  
1183 required cryptographic functionality. Both objectives together ensure that the  
1184 communication between the Meter and the TOE cannot be disclosed.

1185 **OE.PhysicalProtection** is of relevance as it ensures that access to the TOE is limited.

#### 1186 **4.3.2.7 T.Infrastructure**

1187 The threat **T.Infrastructure** is countered by a combination of the security objectives  
1188 **O.Firewall**, **O.SeparateIF**, **O.Meter** and **O.Crypt**.

1189 **O.Firewall** is the core objective that counters this threat. It ensures that all communication  
1190 flows to the WAN are initiated by the TOE. The fact that the TOE does not offer any services  
1191 to the WAN side and will not react to any requests (except the wake-up call) from the WAN is  
1192 a significant aspect in countering this threat. Further the TOE will only communicate using  
1193 encrypted channels to authenticated and trustworthy parties which mitigates the possibility  
1194 that an attacker could try to hijack a communication.

1195 **O.Meter** defines that the TOE will enforce the encryption and integrity protection for the  
1196 communication with the Meter.

1197 **O.SeparateIF** facilitates the disjunction of the WAN from the LMN.

---

---

1198 **O.Crypt** supports the mitigation of this threat by providing the required cryptographic  
1199 primitives.

#### 1200 **4.3.2.8 T.ResidualData**

1201 The threat **T.ResidualData** is mitigated by the security objective **O.Protect** as this security  
1202 objective defines that the TOE shall delete information as soon as it is not longer used.  
1203 Assuming that a TOE follows this requirement an attacker cannot read out any residual  
1204 information as it does simply not exist.

#### 1205 **4.3.2.9 T.ResidentData**

1206 The threat **T.ResidentData** is countered by a combination of the security objectives **O.Access**,  
1207 **O.Firewall**, **O.Protect** and **O.Crypt**. Further, the environment (**OE.PhysicalProtection** and  
1208 **OE.TrustedAdmins**) contributes to this.

1209 **O.Access** defines that the TOE shall control the access of users to information via the external  
1210 interfaces.

1211 The aspect of a local attacker with physical access to the TOE is covered by a combination of  
1212 **O.Protect** (defining the detection of physical manipulation) and **O.Crypt** (requiring the  
1213 encryption of persistently stored TSF and user data of the TOE). In addition, the physical  
1214 protection provided by the environment (**OE.PhysicalProtection**) and the Gateway  
1215 Administrator (**OE.TrustedAdmins**) who could realise a physical manipulation contribute to  
1216 counter this threat.

1217 The aspect of a WAN attacker is covered by **O.Firewall** as this objective ensures that an  
1218 adequate level of protection is realised against attacks from the WAN side.

#### 1219 **4.3.2.10 T.Privacy**

1220 The threat **T.Privacy** is primarily addressed by the security objectives **O.Meter**, **O.Crypt** and  
1221 **O.Firewall** as these objective ensures that the TOE will only distribute Meter Data to external  
1222 parties in the WAN as defined in the corresponding Processing Profiles and that the data will

---

1223 be protected for the transfer. **OE.Profile** is present to ensure that the Processing Profiles are  
1224 obtained from a trustworthy and reliable source only.  
1225 Finally, **O.Conceal** ensures that an attacker cannot obtain the relevant information for this  
1226 threat by observing external characteristics of the information flow.

### 1227 **4.3.3 Coverage of organisational security policies**

1228 The following sections provide more detailed information about how the security objectives  
1229 for the environment and the TOE cover the organizational security policies.

#### 1230 **4.3.3.1 OSP.SM**

1231 The Organizational Security Policy **OSP.SM** that mandates that the TOE utilises the services of  
1232 a certified Security Module is directly addressed by the security objectives **OE.SM** and  
1233 **O.Crypt**. The objective **OE.SM** addresses the functions that the Security Module shall be  
1234 utilised for as defined in **OSP.SM** and also requires a certified Security Module. **O.Crypt**  
1235 defines the cryptographic functionalities for the TOE itself. In this context, it has to be  
1236 ensured that the Security Module is operated in accordance with its guidance  
1237 documentation.

#### 1238 **4.3.3.2 OSP.Log**

1239 The Organizational Security Policy **OSP.Log** that mandates that the TOE maintains an audit  
1240 log is directly addressed by the security objective for the TOE **O.Log**.  
1241 **O.Access** contributes to the implementation of the OSP as it defines that also Gateway  
1242 Administrators are not allowed to read/modify all data. This is of specific importance to  
1243 ensure the confidentiality and integrity of the log data as is required by the **OSP.Log**.

### 1244 **4.3.4 Coverage of assumptions**

1245 The following sections provide more detailed information about how the security objectives  
1246 for the environment cover the assumptions.

---

---

1247 **4.3.4.1 A.ExternalPrivacy**

1248 The assumption **A.ExternalPrivacy** is directly and completely covered by the security  
1249 objective **OE.ExternalPrivacy**. The assumption and the objective for the environment are  
1250 drafted in a way that the correspondence is obvious.

1251 **4.3.4.2 A.TrustedAdmins**

1252 The assumption **A.TrustedAdmins** is directly and completely covered by the security  
1253 objective **OE.TrustedAdmins**. The assumption and the objective for the environment are  
1254 drafted in a way that the correspondence is obvious.

1255 **4.3.4.3 A.PhysicalProtection**

1256 The assumption **A.PhysicalProtection** is directly and completely covered by the security  
1257 objective **OE.PhysicalProtection**. The assumption and the objective for the environment are  
1258 drafted in a way that the correspondence is obvious.

1259 **4.3.4.4 A.ProcessProfile**

1260 The assumption **A.ProcessProfile** is directly and completely covered by the security objective  
1261 **OE.Profile**. The assumption and the objective for the environment are drafted in a way that  
1262 the correspondence is obvious.

1263 **4.3.4.5 A.Update**

1264 The assumption **A.Update** is directly and completely covered by the security objective  
1265 **OE.Update**. The assumption and the objective for the environment are drafted in a way that  
1266 the correspondence is obvious.

1267 **4.3.4.6 A.Network**

1268 The assumption **A.Network** is directly and completely covered by the security objective  
1269 **OE.Network**. The assumption and the objective for the environment are drafted in a way  
1270 that the correspondence is obvious.

1271 **4.3.4.7 A.Keygen**

1272 The assumption **A.Network** is directly and completely covered by the security objective  
 1273 **OE.Network**. The assumption and the objective for the environment are drafted in a way  
 1274 that the correspondence is obvious.

1275 **5 Extended Component definition**

1276 **5.1 Communication concealing (FPR\_CON)**

1277 The additional family Communication concealing (FPR\_CON) of the Class FPR (Privacy) is  
 1278 defined here to describe the specific IT security functional requirements of the TOE. The TOE  
 1279 shall prevent attacks against Personally Identifiable Information (PII) of the Consumer that  
 1280 may be obtained by an attacker by observing the encrypted communication of the TOE with  
 1281 remote entities.

1282 **5.2 Family behaviour**

1283 This family defines requirements to mitigate attacks against communication channels in  
 1284 which an attacker tries to obtain privacy relevant information based on characteristics of an  
 1285 encrypted communication channel. Examples include but are not limited to an analysis of the  
 1286 frequency of communication or the transmitted workload.

1287 **5.3 Component levelling**

1288 FPR\_CON: Communication concealing ----- 1

1289 **5.4 Management**

1290 The following actions could be considered for the management functions in FMT:

1291 a. Definition of the interval in FPR\_CON.1.2 if definable within the operational phase of  
 1292 the TOE.

---

1293           **5.5 Audit**

1294           There are no auditable events foreseen.

1295           **5.6 Communication concealing (FPR\_CON.1)**

1296           Hierarchical to:                       No other components.

1297           Dependencies:                            No dependencies.

1298           FPR\_CON.1.1                           **The TSF shall enforce the [assignment: *information flow***  
1299                                                   ***policy*] in order to ensure that no personally identifiable**  
1300                                                   **information (PII) can be obtained by an analysis of**  
1301                                                   **[assignment: *characteristics of the information flow that***  
1302                                                   ***need to be concealed*].**

1303           FPR\_CON.1.2                           **The TSF shall connect to [assignment: *list of external***  
1304                                                   ***entities*] in intervals as follows [selection: *weekly, daily,***  
1305                                                   ***hourly, [assignment: *other interval*]] to conceal the data***  
1306                                                   **flow.**

## 1307 6 Security Requirements

### 1308 6.1 Overview

1309 This chapter describes the security functional and the assurance requirements which have to  
 1310 be fulfilled by the TOE. Those requirements comprise functional components from part 2 of  
 1311 [CC] and the assurance components as defined for the Evaluation Assurance Level 4 from  
 1312 part 3 of [CC].

1313 The following notations are used:

- 1314 • **Refinement** operation (denoted by **bold text**): is used to add details to a  
 1315 requirement, and thus further restricts a requirement. In case that a word has been  
 1316 deleted from the original text this refinement is indicated by crossed out ~~bold text~~.
- 1317 • **Selection** operation (denoted by underlined text): is used to select one or more  
 1318 options provided by the [CC] in stating a requirement.
- 1319 • **Assignment** operation (denoted by *italicised text*): is used to assign a specific value to  
 1320 an unspecified parameter, such as the length of a password.
- 1321 • **Iteration** operation: are identified with a suffix in the name of the SFR (e.g.  
 1322 FDP\_IFC.2/FW).

1323 It should be noted that the requirements in the following chapters are not necessarily be  
 1324 ordered alphabetically. Where useful the requirements have been grouped.

1325 The following table summarises all TOE security functional requirements of this ST:

Class FAU: Security Audit	
FAU_ARP.1/SYS	Security alarms for system log
FAU_GEN.1/SYS	Audit data generation for system log
FAU_SAA.1/SYS	Potential violation analysis for system log
FAU_SAR.1/SYS	Audit review for system log
FAU_STG.4/SYS	Prevention of audit data loss for the system log
FAU_GEN.1/CON	Audit data generation for consumer log
FAU_SAR.1/CON	Audit review for consumer log
FAU_STG.4/CON	Prevention of audit data loss for the consumer log
FAU_GEN.1/CAL	Audit data generation for calibration log
FAU_SAR.1/CAL	Audit review for calibration log
FAU_STG.4/CAL	Prevention of audit data loss for the calibration log

FAU_GEN.2	User identity association
FAU_STG.2	Guarantees of audit data availability
<b>Class FCO: Communication</b>	
FCO_NRO.2	Enforced proof of origin
<b>Class FCS: Cryptographic Support</b>	
FCS_CKM.1/TLS	Cryptographic key generation for TLS
FCS_COP.1/TLS	Cryptographic operation for TLS
FCS_CKM.1/CMS	Cryptographic key generation for CMS
FCS_COP.1/CMS	Cryptographic operation for CMS
FCS_CKM.1/MTR	Cryptographic key generation for Meter communication encryption
FCS_COP.1/MTR	Cryptographic operation for Meter communication encryption
FCS_CKM.4	Cryptographic key destruction
FCS_COP.1/HASH	Cryptographic operation for Signatures
FCS_COP.1/MEM	Cryptographic operation for TSF and user data encryption
<b>Class FDP: User Data Protection</b>	
FDP_ACC.2	Complete Access Control
FDP_ACF.1	Security attribute based access control
FDP_IFC.2/FW	Complete information flow control for firewall
FDP_IFF.1/FW	Simple security attributes for Firewall
FDP_IFC.2/MTR	Complete information flow control for Meter information flow
FDP_IFF.1/MTR	Simple security attributes for Meter information
FDP_RIP.2	Full residual information protection
FDP_SDI.2	Stored data integrity monitoring and action
<b>Class FIA: Identification and Authentication</b>	
FIA_ATD.1	User attribute definition
FIA_AFL.1	Authentication failure handling
FIA_UAU.2	User authentication before any action
FIA_UAU.5	Multiple authentication mechanisms
FIA_UAU.6	Re-Authenticating
FIA_UID.2	User identification before any action
FIA_USB.1	User-subject binding
<b>Class FMT: Security Management</b>	
FMT_MOF.1	Management of security functions behaviour
FMT_SMF.1	Specification of Management Functions
FMT_SMR.1	Security roles
FMT_MSA.1/AC	Management of security attributes for Gateway access policy
FMT_MSA.3/AC	Static attribute initialisation for Gateway access policy
FMT_MSA.1/FW	Management of security attributes for Firewall policy
FMT_MSA.3/FW	Static attribute initialisation for Firewall policy
FMT_MSA.1/MTR	Management of security attributes for Meter policy
FMT_MSA.3/MTR	Static attribute initialisation for Meter policy

<b>Class FPR: Privacy</b>	
FPR_CON.1	Communication Concealing
FPR_PSE.1	Pseudonymity
<b>Class FPT: Protection of the TSF</b>	
FPT_FLS.1	Failure with preservation of secure state
FPT_RPL.1	Replay Detection
FPT_STM.1	Reliable time stamps
FPT_TST.1	TSF testing
FPT_PHP.1	Passive detection of physical attack
<b>Class FTP: Trusted path/channels</b>	
FTP_ITC.1/WAN	Inter-TSF trusted channel for WAN
FTP_ITC.1/MTR	Inter-TSF trusted channel for Meter
FTP_ITC.1/USR	Inter-TSF trusted channel for User

1326 **Table 9: List of Security Functional Requirements**

1327 **6.2 Class FAU: Security Audit**

1328 **6.2.1 Introduction**

1329 The TOE compliant to this Security Target shall implement three different audit logs as  
 1330 defined in **OSP.Log** and **O.Log**. The following table provides an overview over the three audit  
 1331 logs before the following chapters introduce the SFRs related to those audit logs.

	<b>System-Log</b>	<b>Consumer-Log</b>	<b>Calibration-Log</b>
<b>Purpose</b>	<ul style="list-style-type: none"> <li>• Inform the Gateway Administrator about security relevant events</li> <li>• Log all events as defined by Common Criteria [CC] for the used SFR</li> <li>• Log all system relevant events on specific functionality</li> <li>• Automated alarms in case of a cumulation of certain events</li> <li>• Inform the Service Technician about the status of the Gateway</li> </ul>	<ul style="list-style-type: none"> <li>• Inform the Consumer about all information flows to the WAN</li> <li>• Inform the Consumer about the Processing Profiles</li> <li>• Inform the Consumer about other metering data (not billing-relevant)</li> <li>• Inform the Consumer about all billing-relevant data needed to verify an invoice</li> </ul>	<ul style="list-style-type: none"> <li>• Track changes that are relevant for the calibration of the TOE relevant data needed to verify an invoice</li> </ul>

<b>Data</b>	<ul style="list-style-type: none"> <li>As defined by CC part 2</li> <li>Augmented by specific events for the security functions</li> </ul>	<ul style="list-style-type: none"> <li>Information about all information flows to the WAN</li> <li>Information about the current and the previous Processing Profiles</li> <li>Non-billing-relevant Meter Data</li> <li>Information about the system status (including relevant errors)</li> <li>Billing-relevant data needed to verify an invoice</li> </ul>	<ul style="list-style-type: none"> <li>Calibration relevant data only</li> </ul>
<b>Access</b>	<ul style="list-style-type: none"> <li>Access by authorised Gateway Administrator and via IF_GW_WAN only</li> <li>Events may only be deleted by an authorised Gateway Administrator via IF_GW_WAN</li> <li>Read access by authorised Service Technician via IF_GW_SRV only</li> </ul>	<ul style="list-style-type: none"> <li>Read access by authorised Consumer and via IF_GW_CON only to the data related to the current consumer</li> </ul>	<ul style="list-style-type: none"> <li>Read access by authorised Gateway Administrator and via IF_GW_WAN only</li> </ul>
<b>Deletion</b>	<ul style="list-style-type: none"> <li>Ring buffer.</li> <li>The availability of data has to be ensured for a sufficient amount of time</li> <li>Overwriting old events is possible if the memory is full.</li> </ul>	<ul style="list-style-type: none"> <li>Ring buffer.</li> <li>The availability of data has to be ensured for a sufficient amount of time.</li> <li>Overwriting old events is possible if the memory is full</li> <li>Retention period is set by authorised Gateway Administrator on request by consumer, data older than this are deleted.</li> </ul>	<ul style="list-style-type: none"> <li>The availability of data has to be ensured over the lifetime of the TOE.</li> </ul>

1332

**Table 10: Overview over audit processes**

1333 **6.2.2 Security Requirements for the System Log**

1334 **6.2.2.1 Security audit automatic response (FAU\_ARP)**

1335 **6.2.2.1.1 FAU\_ARP.1/SYS: Security Alarms for system log**

1336 FAU\_ARP.1.1/SYS The TSF shall ~~take~~ *inform an authorised Gateway Administrator and*  
 1337 *create a log entry in the system log*<sup>34</sup> upon detection of a potential  
 1338 security violation.

1339 Hierarchical to: No other components

1340 Dependencies: FAU\_SAA.1 Potential violation analysis

1341 **6.2.2.2 Security audit data generation (FAU\_GEN)**

1342 **6.2.2.2.1 FAU\_GEN.1/SYS: Audit data generation for system log**

1343 FAU\_GEN.1.1/SYS The TSF shall be able to generate an audit record of the following  
 1344 auditable events:  
 1345 a) Start-up and shutdown of the audit functions;  
 1346 b) All auditable events for the basic<sup>35</sup> level of audit; and  
 1347 c) *other non privacy relevant auditable events: none*<sup>36</sup>.

1348 FAU\_GEN.1.2/SYS The TSF shall record within each audit record at least the following  
 1349 information:  
 1350 a) Date and time of the event, type of event, subject identity (if  
 1351 applicable), and the outcome (success or failure) of the event; and  
 1352 b) For each audit event type, based on the auditable event definitions  
 1353 of the functional components included in the ~~PP/ST~~<sup>37</sup>, *other audit*  
 1354 *relevant information: none*<sup>38</sup>.

1355 Hierarchical to: No other components

1356 Dependencies: FPT\_STM.1

---

34 [assignment: *list of actions*]

35 [selection, choose one of: *minimum, basic, detailed, not specified*]

36 [assignment: *other specifically defined auditable events*]

37 [refinement: *PP/ST*]

38 [assignment: *other audit relevant information*]

---

1357 **6.2.2.3 Security audit analysis (FAU\_SAA)**

1358 **6.2.2.3.1 FAU\_SAA.1/SYS: Potential violation analysis for system log**

1359 FAU\_SAA.1.1./SYS The TSF shall be able to apply a set of rules in monitoring the audited  
1360 events and based upon these rules indicate a potential violation of  
1361 the enforcement of the SFRs.

1362 FAU\_SAA.1.2/SYS The TSF shall enforce the following rules for monitoring audited  
1363 events:

- 1364 a) Accumulation or combination of
- 1365 • *Start-up and shutdown of the audit functions*
  - 1366 • *all auditable events for the basic level of audit*
  - 1367 • *all types of failures in the TSF as listed in FPT\_FLS.1*<sup>39</sup>
- 1368 known to indicate a potential security violation.
- 1369 b) *any other rules: none*<sup>40</sup>.

1370 Hierarchical to: No other components

1371 Dependencies: FAU\_GEN.1

1372 **6.2.2.4 Security audit review (FAU\_SAR)**

1373 **6.2.2.4.1 FAU\_SAR.1/SYS: Audit Review for system log**

1374 FAU\_SAR.1.1/SYS The TSF shall provide *only authorised Gateway Administrators via the*  
1375 *IF\_GW\_WAN interface and authorised Service Technicians via the*  
1376 *IF\_GW\_SRV interface*<sup>41</sup> with the capability to read *all information*<sup>42</sup>  
1377 from the **system** audit records<sup>43</sup>.

1378 FAU\_SAR.1.2/SYS The TSF shall provide the audit records in a manner suitable for the  
1379 user to interpret the information.

1380 Hierarchical to: No other components

1381 Dependencies: FAU\_GEN.1

---

39 [assignment: *subset of defined auditable events*]

40 [assignment: *any other rules*]

41 [assignment: *authorised users*]

42 [assignment: *list of audit information*]

43 [refinement: *audit records*]

---

1382 **6.2.2.5 Security audit event storage (FAU\_STG)**

1383 **6.2.2.5.1 FAU\_STG.4/SYS: Prevention of audit data loss for system log**

1384 FAU\_STG.4.1/SYS The TSF shall overwrite the oldest stored audit records<sup>44</sup> and *other*  
 1385 *actions to be taken in case of audit storage failure: none*<sup>45</sup> if the  
 1386 **system** audit trail<sup>46</sup> is full.

1387 Hierarchical to: FAU\_STG.3 Action in case of possible audit data loss

1388 Dependencies: FAU\_STG.1 Protected audit trail storage

1389 **Application Note 4:** The size of the audit trail that is available before the oldest events get  
 1390 overwritten is configurable for the Gateway Administrator.

1391 **6.2.3 Security Requirements for the Consumer Log**

1392 **6.2.3.1 Security audit data generation (FAU\_GEN)**

1393 **6.2.3.1.1 FAU\_GEN.1/CON: Audit data generation for consumer log**

1394 FAU\_GEN.1.1/CON The TSF shall be able to generate an audit record of the following  
 1395 auditable events:  
 1396 a) Start-up and shutdown of the audit functions;  
 1397 b) All auditable events for the not specified<sup>47</sup> level of audit; and  
 1398 c) *all audit events as listed in Table 11 and additional events: none*<sup>48</sup>.

1399 FAU\_GEN.1.2/CON The TSF shall record within each audit record at least the following  
 1400 information:  
 1401 a) Date and time of the event, type of event, subject identity (if  
 1402 applicable), and the outcome (success or failure) of the event; and  
 1403 b) For each audit event type, based on the auditable event definitions  
 1404 of the functional components included in the **PP/ST**<sup>49</sup>, *additional*  
 1405 *information as listed in Table 11 and additional events: none*<sup>50</sup>.

44 [selection, choose one of: “ignore audited events”, “prevent audited events, except those taken by the authorised user with special rights”, “overwrite the oldest stored audit records”]

45 [assignment: *other actions to be taken in case of audit storage failure*]

46 [refinement: *audit trail*]

47 [selection, choose one of: *minimum, basic, detailed, not specified*]

48 [assignment: *other specifically defined auditable events*]

49 [refinement: *PP/ST*]

50 [assignment: *other audit relevant information*]

1406 Hierarchical to: No other components  
 1407 Dependencies: FPT\_STM.1

Event	Additional Information
Any change to a Processing Profile	The new and the old Processing Profile
Any submission of Meter Data to an external entity	The Processing Profile that lead to the submission The submitted values
Any submission of Meter Data that is not billing-relevant	-
Billing-relevant data	-
Any administrative action performed	-
Relevant system status information including relevant errors	-

1408 **Table 11: Events for consumer log**

1409 **6.2.3.2 Security audit review (FAU\_SAR)**

1410 **6.2.3.2.1 FAU\_SAR.1/CON: Audit Review for consumer log**

1411 FAU\_SAR.1.1/CON The TSF shall provide *only authorised Consumer via the IF\_GW\_CON*  
 1412 *interface*<sup>51</sup> with the capability to read *all information that are related*  
 1413 *to them*<sup>52</sup> from the **consumer** audit records<sup>53</sup>.

1414 FAU\_SAR.1.2/CON The TSF shall provide the audit records in a manner suitable for the  
 1415 user to interpret the information.

1416 Hierarchical to: No other components

1417 Dependencies: FAU\_GEN.1

1418 **Application Note 5:** FAU\_SAR.1.2/CON shall ensure that the Consumer is able to interpret  
 1419 the information that is provided to him in a way that allows him to  
 1420 verify the invoice.

51 [assignment: *authorised users*]

52 [assignment: *list of audit information*]

53 [refinement: *audit records*]

1421 **6.2.3.3 Security audit event storage (FAU\_STG)**

1422 **6.2.3.3.1 FAU\_STG.4/CON: Prevention of audit data loss for the consumer log**

1423 FAU\_STG.4.1/CON The TSF shall overwrite the oldest stored audit records and *interrupt*  
 1424 *metrological operation in case that the oldest audit record must still*  
 1425 *be kept for billing verification* <sup>54</sup> if the **consumer** audit trail is full.

1426 Hierarchical to: FAU\_STG.3 Action in case of possible audit data loss

1427 Dependencies: FAU\_STG.1 Protected audit trail storage

1428 **Application Note 6:** The size of the audit trail that is available before the oldest events get  
 1429 overwritten is configurable for the Gateway Administrator.

1430 **6.2.4 Security Requirements for the Calibration Log**

1431 **6.2.4.1 Security audit data generation (FAU\_GEN)**

1432 **6.2.4.1.1 FAU\_GEN.1/CAL: Audit data generation for calibration log**

1433 FAU\_GEN.1.1/CAL The TSF shall be able to generate an audit record of the following  
 1434 auditable events:  
 1435 a) Start-up and shutdown of the audit functions;  
 1436 b) All auditable events for the not specified <sup>55</sup> level of audit; and  
 1437 c) *all calibration-relevant information according to Table 12* <sup>56</sup>.

1438 FAU\_GEN.1.2/CAL The TSF shall record within each audit record at least the following  
 1439 information:  
 1440 a) Date and time of the event, type of event, subject identity (if  
 1441 applicable), and the outcome (success or failure) of the event; and  
 1442 b) For each audit event type, based on the auditable event definitions  
 1443 of the functional components included in the **PP/ST** <sup>57</sup>, *other audit*  
 1444 *relevant information: none* <sup>58</sup>.

54 [assignment: *other actions to be taken in case of audit storage failure*]

55 [selection, choose one of: *minimum, basic, detailed, not specified*]

56 [assignment: *other specifically defined auditable events*]

57 [refinement: *PP/ST*]

58 [assignment: *other audit relevant information*]

- 1445 Hierarchical to: No other components
- 1446 Dependencies: FPT\_STM.1
- 1447 **Application Note 7:** The calibration log serves to fulfil national requirements in the
- 1448 context of the calibration of the TOE.

Event / Parameter	Content
National calibration authority	National calibration authority or certification body identifier (in German ‚Prüfstellenbezeichnung‘), and year of calibration („Eichjahr“), year number of CE sign, and all changes of these MUST be logged in calibration log.
Commissioning	Commissioning of the SMGW MUST be logged in calibration log.
Calibration, diagnosis-test	Cases of (re-)calibration, look-up, or diagnosis-test MUST be logged in calibration log.
Event of self-test	Initiation of self-test MUST be logged in calibration log.
New meter	Connection and registration of a new meter MUST be logged in calibration log.
Meter removal	Removal of a meter from SMGW MUST be logged in calibration log.
Change of tarification profiles	<p>Every change (incl. parameter change) of a tarification profile according to [TR-03109-1, 4.4], provided the parameter is relevant for calibration regulations (see below) as well as new storage or removal of tarification profiles MUST be logged in calibration log.</p> <p>Parameter relevant for calibration regulations are:</p> <ul style="list-style-type: none"> <li>• Device-ID of a meter - Unique identifier of the meter, which send the input values for a TAF</li> <li>• OBIS value of the measured variable of the meter - Unique value for the measured variable of the meter for the used TAF</li> <li>• Metering point name - Unique name of the metering point</li> <li>• Billing period - Period in which a billing should be done</li> <li>• Consumer ID</li> <li>• Validity period - Period for which the TAF is booked</li> <li>• Definition of tariff stages - Defines different tariff stages and associated OBIS values. Here it will be defined which tariff stage is valid at the time of rule set activation</li> <li>• Tariff switching time - Defines to the split second the switching of tariff stages. The time points can be defined as periodic values</li> <li>• Register period - Time distance of two consecutive measured value acquisitions for meter readings</li> </ul>

<p>Change of meter profiles</p>	<p>Every change (incl. parameter change) of a meter profile according to [TR-03109-1, 4.4], provided the parameter is relevant for calibration regulations (see below) as well as new storage or removal of meter profiles MUST be logged in calibration log.</p> <p>Parameter relevant for legal metrology are:</p> <ul style="list-style-type: none"> <li>• <i>Device-ID</i> - Unique identifier of the meter according to DIN 43863-5</li> <li>• <i>Key material</i> - Public key for inner signature (dependent on the used meter in LMN)</li> <li>• Register period - Interval during receipt of meter values</li> <li>• <i>Displaying interval</i> ('Anzeigeintervall') - Interval during which the actual meter value (only during display) must be updated in case of bidirectional communication between meter and SMGW</li> <li>• <i>Balancing</i> ('Saldierend') - Determines if the meter is balancing ('saldierend') and meter values can grow and fall</li> <li>• <i>OBIS values</i> - OBIS values according to IEC-62056-6-1 resp. EN 13757-1</li> <li>• <i>Converter factor</i> ('Wandlerfaktor') - Value is 1 in case of directly connected meter. In usage of converter counter ('Wandlerzähler') the value may be different.</li> </ul>
<p>Software update</p>	<p>Every update of the code which touches calibration regulations (serialized COSEM-objects, rules) MUST be logged in calibration log.</p>
<p>Firmware update</p>	<p>Every firmware update (incl. operating system update if applicable) MUST be logged in calibration log.</p>
<p>Error messages of a meter</p>	<p>All FATAL messages of a connected meter MUST be logged in calibration log according to</p> <p>0 - no error</p> <p>1 - Warning, no action to be done according to calibration authority, meter value valid</p> <p>2 - Temporal error, send meter value will be marked as invalid, the value in meter field ('Messwertfeld') could be used according to the rules of [VDE4400] resp. [G865] as replacement value ('Ersatzwert') in backend.</p> <p>3 - Temporal error, send meter value is invalid; the value in the meter field ('Messwertfeld') cannot be used as replacement value in backend.</p> <p>4 - Fatal error (meter defect), actual send value is invalid and all future values will be invalid.</p> <p>including the device-ID.</p>
<p>Error messages of a SMGW</p>	<p>All self-test and calibration regulations relevant errors MUST be logged in calibration log.</p>

Table 12: Content of calibration log

1450 **6.2.4.2 Security audit review (FAU\_SAR)**

1451 **6.2.4.2.1 FAU\_SAR.1/CAL: Audit Review for the calibration log**

1452	FAU_SAR.1.1/CAL	The TSF shall provide <i>only authorised Gateway Administrators via the IF_GW_WAN interface</i> <sup>59</sup> with the capability to read <i>all information</i> <sup>60</sup> from the <b>calibration</b> audit records <sup>61</sup> .
1453		
1454		
1455	FAU_SAR.1.2/CAL	The TSF shall provide the audit records in a manner suitable for the user to interpret the information.
1456		
1457	Hierarchical to:	No other components
1458	Dependencies:	FAU_GEN.1

1459 **6.2.4.3 Security audit event storage (FAU\_STG)**

1460 **6.2.4.3.1 FAU\_STG.4/CAL: Prevention of audit data loss for calibration log**

1461	FAU_STG.4.1/CAL	The TSF shall <u>ignore audited events</u> <sup>62</sup> and <i>stop the operation of the TOE and inform a Gateway Administrator</i> <sup>63</sup> if the <b>calibration</b> audit trail <sup>64</sup> is full.
1462		
1463		
1464	Hierarchical to:	FAU_STG.3 Action in case of possible audit data loss
1465	Dependencies:	FAU_STG.1 Protected audit trail storage
1466	<b>Application Note 8:</b>	As outlined in the introduction it has to be ensured that the events of the calibration log are available over the lifetime of the TOE.
1467

1493	<b>6.3.1 Non-repudiation of origin (FCO_NRO)</b>	
1494	<b>6.3.1.1 FCO_NRO.2: Enforced proof of origin</b>	
1495	FCO_NRO.2.1	The TSF shall enforce the generation of evidence of origin for transmitted <i>Meter Data</i> <sup>70</sup> at all times.
1496		
1497	FCO_NRO.2.2	The TSF shall be able to relate the <i>key material used for signature</i> <sup>71,72</sup> of the originator of the information, and the <i>signature</i> <sup>73</sup> of the information to which the evidence applies.
1498		
1499		
1500	FCO_NRO.2.3	The TSF shall provide a capability to verify the evidence of origin of information to <i>recipient, Consumer</i> <sup>74</sup> given <i>limitations of the digital signature according to TR-03109-1</i> <sup>75</sup> .
1501		
1502		
1503	Hierarchical to:	FCO_NRO.1 Selective proof of origin
1504	Dependencies:	FIA_UID.1 Timing of identification
1505	<b>Application Note 11:</b>	FCO_NRO.2 requires that the TOE calculates a signature over Meter Data that is submitted to external entities.
1506		
1507		Therefore, the TOE has to create a hash value over the Data To Be Signed (DTBS) as defined in FCS_COP.1/HASH. The creation of the
1508		actual signature however is performed by the Security Module.
1509

1565 **6.4.2.2 Cryptographic operation (FCS\_COP)**

1566 **6.4.2.2.1 FCS\_COP.1/CMS: Cryptographic operation for CMS**

1567 FCS\_COP.1.1/CMS The TSF shall perform *symmetric encryption, decryption and integrity*  
 1568 *protection* in accordance with a specified cryptographic algorithm  
 1569 *AES-CBC-CMAC or AES-GCM*<sup>86</sup> and cryptographic key sizes *128 bit*<sup>87</sup>  
 1570 that meet the following: *[FIPS Pub. 197], [NIST 800-38D], [RFC 4493],*  
 1571 *[RFC 5084], and [RFC 5652] in combination with [NIST 800-38A]*<sup>88</sup>.

1572 Hierarchical to: No other components.

1573 Dependencies: [FDP\_ITC.1 Import of user data without security attributes, or  
 1574 FDP\_ITC.2 Import of user data with security attributes, or  
 1575 FCS\_CKM.1 Cryptographic key generation], fulfilled by  
 1576 FCS\_CKM.1/CMS  
 1577 FCS\_CKM.4 Cryptographic key destruction

1578 **Application Note 17:** The TOE uses only cryptographic specifications and algorithms as  
 1579 described in [TR-03109-3].

1580 **6.4.3 Cryptographic support for Meter communication encryption**

1581 **6.4.3.1 Cryptographic key management (FCS\_CKM)**

1582 **6.4.3.1.1 FCS\_CKM.1/MTR: Cryptographic key generation for Meter**  
 1583 ***communication (symmetric encryption)***

1584 FCS\_CKM.1.1/MTR The TSF shall generate cryptographic keys in accordance with a  
 1585 specified cryptographic key generation algorithm *AES-CMAC*<sup>89</sup> and  
 1586 specified cryptographic key sizes *128 bit*<sup>90</sup> that meet the following:  
 1587 *[FIPS Pub. 197], and [RFC 4493]*<sup>91</sup>.

1588 Hierarchical to: No other components.

1589 Dependencies: [FCS\_CKM.2 Cryptographic key distribution, or

86 [assignment: *list of cryptographic operations*]

87 [assignment: *cryptographic key sizes*]

88 [assignment: *list of standards*]

89 [assignment: *cryptographic key generation algorithm*]

90 [assignment: *cryptographic key sizes*]

91 [assignment: *list of standards*]

1590 FCS\_COP.1 Cryptographic operation], fulfilled by FCS\_COP.1/MTR  
 1591 FCS\_CKM.4 Cryptographic key destruction  
 1592 **Application Note 18:** The TOE uses only cryptographic specifications and algorithms as  
 1593 described in [TR-03109-3].

1594 **6.4.3.2 Cryptographic operation (FCS\_COP)**

1595 **6.4.3.2.1 FCS\_COP.1/MTR: Cryptographic operation for Meter**  
 1596 **communication encryption**

1597 FCS\_COP.1.1/MTR The TSF shall perform *symmetric encryption, decryption, integrity*  
 1598 *protection*<sup>92</sup> in accordance with a specified cryptographic algorithm  
 1599 *AES-CBC-CMAC*<sup>93</sup> and cryptographic key sizes *128 bit*<sup>94</sup> that meet  
 1600 the following: *[FIPS Pub. 197] and [RFC 4493] in combination with*  
 1601 *[ISO 10116]*<sup>95</sup>.

1602 Hierarchical to: No other components.

1603 Dependencies: [FDP\_ITC.1 Import of user data without security attributes, or  
 1604 FDP\_ITC.2 Import of user data with security attributes, or  
 1605 FCS\_CKM.1 Cryptographic key generation], fulfilled by  
 1606 FCS\_CKM.1/MTR  
 1607 FCS\_CKM.4 Cryptographic key destruction

1608 **Application Note 19:** The ST allows different scenarios of key generation for Meter  
 1609 communication encryption. Those are:  
 1610 1. If a TLS encryption is being used, the key  
 1611 generation/negotiation is as defined by FCS\_CKM.1/TLS.  
 1612 2. If AES encryption is being used, the key has been brought into  
 1613 the Gateway via a management function during the pairing  
 1614 process for the Meter (see FMT\_SMF.1) as defined by  
 1615 FCS\_COP.1/MTR.

1616 **Application Note 20:** If the connection between the Meter and TOE is unidirectional, the  
 1617 communication between the Meter and the TOE is secured by the  
 1618 use of a symmetric AES encryption. If a bidirectional connection  
 1619 between the Meter and the TOE is established, the communication is

92 [assignment: *list of cryptographic operations*]

93 [assignment: *cryptographic algorithm*]

94 [assignment: *cryptographic key sizes*]

95 [assignment: *list of standards*]

1620 secured by a TLS channel as described in chapter 6.4.1. As the TOE  
 1621 shall be interoperable with all kind of Meters, both kinds of  
 1622 encryption are implemented.

1623 **Application Note 21:** The TOE uses only cryptographic specifications and algorithms as  
 1624 described in [TR-03109-3].

1625 **6.4.4 General Cryptographic support**

1626 **6.4.4.1 Cryptographic key management (FCS\_CKM)**

1627 **6.4.4.1.1 FCS\_CKM.4: Cryptographic key destruction**

1628 FCS\_CKM.4.1 The TSF shall destroy cryptographic keys in accordance with a specified  
 1629 cryptographic key destruction method *Zeroisation*<sup>96</sup> that meets the  
 1630 following: *none*<sup>97</sup>.

1631 Hierarchical to: No other components.

1632 Dependencies: [FDP\_ITC.1 Import of user data without security attributes, or  
 1633 FDP\_ITC.2 Import of user data with security attributes, or  
 1634 FCS\_CKM.1 Cryptographic key generation], fulfilled by FCS\_CKM.1/TLS and  
 1635 FCS\_CKM.1/CMS and FCS\_CKM.1/MTR

1636 **Application Note 22:** Please note that as against the requirement FDP\_RIP.2, the mechanisms  
 1637 implementing the requirement from FCS\_CKM.4 shall be suitable to avoid  
 1638 attackers with physical access to the TOE from accessing the keys after they  
 1639 are no longer used.

96 [assignment: *cryptographic key destruction method*]

97 [assignment: *list of standards*]

1640 **6.4.4.2 Cryptographic operation (FCS\_COP)**

1641 **6.4.4.2.1 FCS\_COP.1/HASH: Cryptographic operation, hashing for signatures**

1642 FCS\_COP.1.1/HASH The TSF shall perform *hashing for signature creation and verification*<sup>98</sup> in  
 1643 accordance with a specified cryptographic algorithm *SHA-256, SHA-384 and*  
 1644 *SHA-512*<sup>99, 100</sup> and cryptographic key sizes *none*<sup>101</sup> that meet the following:  
 1645 *[FIPS Pub. 180-4]*<sup>102</sup>.

1646 Hierarchical to: No other components.

1647 Dependencies: [FDP\_ITC.1 Import of user data without security attributes, or  
 1648 FDP\_ITC.2 Import of user data with security attributes, or  
 1649 FCS\_CKM.1 Cryptographic key generation<sup>103</sup>  
 1650 FCS\_CKM.4 Cryptographic key destruction

1651 **Application Note 23:** The TOE is only responsible for hashing of data in the context of digital  
 1652 signatures. The actual signature operation and the handling (i.e. protection)  
 1653 of the cryptographic keys in this context is performed by the Security  
 1654 Module.

1655 **Application Note 24:** The TOE uses only cryptographic specifications and algorithms as described in  
 1656 [TR-03109-3].

1657 **6.4.4.2.2 FCS\_COP.1/MEM: Cryptographic operation, encryption of TSF and user**  
 1658 **data**

1659 FCS\_COP.1.1/MEM The TSF shall perform *TSF and user data encryption and decryption*<sup>104</sup> in  
 1660 accordance with a specified cryptographic algorithm *AES-XTS*<sup>105</sup> and

1661		cryptographic key sizes <i>128 bit</i> <sup>106</sup> that meet the following: <i>[FIPS Pub. 197]</i>
1662		and <i>[NIST 800-38E]</i> <sup>107</sup> .
1663	Hierarchical to:	No other components.
1664	Dependencies:	[FDP_ITC.1 Import of user data without security attributes, or
1665		FDP_ITC.2 Import of user data with security attributes, or
1666		FCS_CKM.1 Cryptographic key generation], not fulfilled s. Application Note 25
1667		FCS_CKM.4 Cryptographic key destruction
1668	<b>Application Note 25:</b>	Please note that for the key generation process an external security module
1669		is used during TOE production.
1670	<b>Application Note 26:</b>	The TOE encrypts its local TSF and user data while it is not in use (i.e. while
1671		stored in a persistent memory).
1672		It shall be noted that this kind of encryption cannot provide an absolute
1673		protection against physical manipulation and does not aim to. It however
1674		contributes to the security concept that considers the protection that is
1675		provided by the environment.

## 1676 6.5 Class FDP: User Data Protection

### 1677 6.5.1 Introduction to the Security Functional Policies

1678 The security functional requirements that are used in the following chapters implicitly define a set of  
 1679 Security Functional Policies (SFP). These policies are introduced in the following paragraphs in more  
 1680 detail to facilitate the understanding of the SFRs:

- 1681 • The **Gateway access SFP** is an access control policy to control the access to objects under the  
 1682 control of the TOE. The details of this access control policy highly depend on the concrete  
 1683 application of the TOE. The access control policy is described in more detail in [TR-03109-1].
- 1684 • The **Firewall SFP** implements an information flow policy to fulfil the objective O.Firewall. All  
 1685 requirements around the communication control that the TOE poses on communications  
 1686 between the different networks are defined in this policy.
- 1687 • The **Meter SFP** implements an information flow policy to fulfil the objective O.Meter. It  
 1688 defines all requirements concerning how the TOE shall handle Meter Data.

## 1689 6.5.2 Gateway Access SFP

### 1690 6.5.2.1 Access control policy (FDP\_ACC)

#### 1691 6.5.2.1.1 FDP\_ACC.2: Complete access control

1692	FDP_ACC.2.1	The TSF shall enforce the <i>Gateway access SFP</i> <sup>108</sup> on
1693		<i>subjects: external entities in WAN, HAN and LMN</i>
1694		<i>objects: any information that is sent to, from or via the TOE and any</i>
1695		<i>information that is stored in the TOE</i> <sup>109</sup> and all operations among
1696		subjects and objects covered by the SFP.
1697	FDP_ACC.2.2	The TSF shall ensure that all operations between any subject controlled by
1698		the TSF and any object controlled by the TSF are covered by an access control
1699		SFP.
1700	Hierarchical to:	FDP_ACC.1 Subset access control
1701	Dependencies:	FDP_ACF.1 Security attribute based access control

#### 1702 6.5.2.1.2 FDP\_ACF.1: Security attribute based access control

1703	FDP_ACF.1.1	The TSF shall enforce the <i>Gateway access SFP</i> <sup>110</sup> to objects based on the
1704		following:
1705		<i>subjects: external entities on the WAN, HAN or LMN side</i>
1706		<i>objects: any information that is sent to, from or via the TOE</i>
1707		<i>attributes: destination interface</i> <sup>111</sup> .
1708	FDP_ACF.1.2	The TSF shall enforce the following rules to determine if an operation among
1709		controlled subjects and controlled objects is allowed:
1710		<ul style="list-style-type: none"> <li>• <i>an authorised Consumer is only allowed to have read access to his own User Data via the interface IF_GW_CON,</i></li> </ul>
1711		<ul style="list-style-type: none"> <li>• <i>an authorised Service Technician is only allowed to have read access</i></li> </ul>
1712		<i>to the system log via the interface IF_GW_SRV, the Service Technician</i>
1713		<i>must not be allowed to read, modify or delete any other TSF data,</i>
1714		<ul style="list-style-type: none"> <li>• <i>an authorised Gateway Administrator is allowed to interact with the</i></li> </ul>
1715		<i>TOE only via IF_GW_WAN,</i>
1716		

---

109 [assignment: *list of subjects and objects*]

110 [assignment: *access control SFP*]

111 [assignment: *list of subjects and objects controlled under the indicated SFP, and for each, the SFP-relevant security attributes, or named groups of SFP-relevant security attributes*]

---

---

1717		<ul style="list-style-type: none"> <li>• <i>only authorised Gateway Administrators are allowed to establish a wake-up call,</i></li> </ul>
1718		
1719		<ul style="list-style-type: none"> <li>• <i>additional rules governing access among controlled subjects and controlled objects using controlled operations on controlled objects or none: none</i> <sup>112, 113</sup></li> </ul>
1720		
1721		
1722	FDP_ACF.1.3	The TSF shall explicitly authorise access of subjects to objects based on the following additional rules: <i>none</i> <sup>114</sup> .
1723		
1724	FDP_ACF.1.4	The TSF shall explicitly deny access of subjects to objects based on the following additional rules:
1725		
1726		<ul style="list-style-type: none"> <li>• <i>the Gateway Administrator is not allowed to read consumption data or the Consumer Log,</i></li> </ul>
1727		
1728		<ul style="list-style-type: none"> <li>• <i>nobody must be allowed to read the symmetric keys used for encryption</i> <sup>115</sup>.</li> </ul>
1729		
1730	Hierarchical to:	No other components
1731	Dependencies:	FDP_ACC.1 Subset access control
1732		FMT_MSA.3 Static attribute initialisation

### 1733 6.5.3 Firewall SFP

#### 1734 6.5.3.1 Information flow control policy (FDP\_IFC)

##### 1735 6.5.3.1.1 FDP\_IFC.2/FW: Complete information flow control for firewall

1736	FDP_IFC.2.1/FW	The TSF shall enforce the <i>Firewall SFP</i> <sup>116</sup> on the TOE, external entities on the WAN side, external entities on the LAN side and all information flowing between them <sup>117</sup> and all operations that cause that information to flow to and from subjects covered by the SFP.
1737		
1738		
1739		
1740	FDP_IFC.2.2/FW	The TSF shall ensure that all operations that cause any information in the TOE to flow to and from any subject in the TOE are covered by an information flow control SFP.
1741		
1742		

---

112 [assignment: *additional rules governing access among controlled subjects and controlled objects using controlled operations on controlled objects or none*]

113 [assignment: *rules governing access among controlled subjects and controlled objects using controlled operations on controlled objects*]

114 [assignment: *rules, based on security attributes, that explicitly authorise access of subjects to objects*]

115 [assignment: *rules, based on security attributes, that explicitly deny access of subjects to objects*]

116 [assignment: *information flow control SFP*]

117 [assignment: *list of subjects and information*]

---

- 1743 Hierarchical to: FDP\_IFC.1 Subset information flow control
- 1744 Dependencies: FDP\_IFF.1 Simple security attributes

1745 **6.5.3.2 Information flow control functions (FDP\_IFF)**

1746 **6.5.3.2.1 FDP\_IFF.1/FW: Simple security attributes for Firewall**

- 1747 FDP\_IFF.1.1/FW The TSF shall enforce the *Firewall SFP* <sup>118</sup> based on the following types of
- 1748 subject and information security attributes:
- 1749 *subjects: The TOE and external entities on the WAN, HAN or LMN side*
- 1750 *information: any information that is sent to, from or via the TOE*
- 1751 *attributes: destination\_interface (TOE, LMN, HAN or WAN),*
- 1752 *source\_interface (TOE, LMN, HAN or WAN), destination\_authenticated,*
- 1753 *source\_authenticated* <sup>119</sup>.
  
- 1754 FDP\_IFF.1.2/FW The TSF shall permit an information flow between a controlled subject and
- 1755 controlled information via a controlled operation if the following rules hold:
- 1756 *(if source\_interface=HAN or source\_interface=TOE) and*
- 1757 *destination\_interface=WAN and*
- 1758 *destination\_authenticated = true*
- 1759 *Connection establishment is allowed*
- 1760
- 1761 *if source\_interface=LMN and*
- 1762 *destination\_interface= TOE and*
- 1763 *source\_authenticated = true*
- 1764 *Connection establishment is allowed*
- 1765
- 1766 *if source\_interface=TOE and*
- 1767 *destination\_interface= LMN and*
- 1768 *destination\_authenticated = true*
- 1769 *Connection establishment is allowed*
- 1770
- 1771 *if source\_interface=HAN and*
- 1772 *destination\_interface= TOE and*
- 1773 *source\_authenticated = true*
- 1774 *Connection establishment is allowed*
- 1775
- 1776 *if source\_interface=TOE and*
- 1777 *destination\_interface= HAN and*
- 1778 *destination\_authenticated = true*
- 1779 *Connection establishment is allowed*

118 [assignment: *information flow control SFP*]

119 [assignment: *list of subjects and information controlled under the indicated SFP, and for each, the security attributes*]

---

1780		<i>else</i>
1781		<i>Connection establishment is denied</i> <sup>120</sup> .
1782	FDP_IFF.1.3/FW	The TSF shall enforce the <i>establishment of a connection to a configured external entity in the WAN after having received a wake-up message on the WAN interface</i> <sup>121</sup> .
1783		
1784		
1785	FDP_IFF.1.4/FW	The TSF shall explicitly authorise an information flow based on the following rules: <i>none</i> <sup>122</sup> .
1786		
1787	FDP_IFF.1.5/FW	The TSF shall explicitly deny an information flow based on the following rules: <i>none</i> <sup>123</sup> .
1788		
1789	Hierarchical to:	No other components
1790	Dependencies:	FDP_IFC.1 Subset information flow control
1791		FMT_MSA.3 Static attribute initialisation
1792	<b>Application Note 27:</b>	It should be noted that the FDP_IFF.1.1/FW facilitates different interfaces of the origin and the destination of an information flow implicitly requires the TOE to implement physically separate ports for WAN, LMN and HAN.
1793		
1794

1797 **6.5.4.1.1 FDP\_IFC.2/MTR: Complete information flow control for Meter information**  
 1798 **flow**

1799 FDP\_IFC.2.1/MTR The TSF shall enforce the *Meter SFP*<sup>124</sup> on the TOE, attached Meters,  
 1800 authorized External Entities in the WAN and all information flowing between  
 1801 them<sup>125</sup> and all operations that cause that information to flow to and from  
 1802 subjects covered by the SFP.

1803 FDP\_IFC.2.2/MTR The TSF shall ensure that all operations that cause any information in the TOE  
 1804 to flow to and from any subject in the TOE are covered by an information  
 1805 flow control SFP.

1806 Hierarchical to: FDP\_IFC.1 Subset information flow control

1807 Dependencies: FDP\_IFF.1 Simple security attributes

1808 **6.5.4.2 Information flow control functions (FDP\_IFF)**

1809 **6.5.4.2.1 FDP\_IFF.1/MTR: Simple security attributes for Meter information**

1810 FDP\_IFF.1.1/MTR The TSF shall enforce the *Meter SFP*<sup>126</sup> based on the following types of  
 1811 subject and information security attributes:  
 1812 • *subjects: TOE, external entities in WAN, Meters located in LMN*  
 1813 • *information: any information that is sent via the TOE*  
 1814 • *attributes: destination interface, source interface (LMN or WAN),*  
 1815 *Processing Profile*<sup>127</sup>.

1816 FDP\_IFF.1.2/MTR The TSF shall permit an information flow between a controlled subject and  
 1817 controlled information via a controlled operation if the following rules hold:  
 1818 • *an information flow shall only be initiated if allowed by a*  
 1819 *corresponding Processing Profile*<sup>128</sup>.

---

124 [assignment: *information flow control SFP*]

125 [assignment: *list of subjects and information*]

126 [assignment: *information flow control SFP*]

127 [assignment: *list of subjects and information controlled under the indicated SFP, and for each, the security attributes*]

128 [assignment: *for each operation, the security attribute-based relationship that must hold between subject and information security attributes*]

---

1820	FDP_IFF.1.3/MTR	The TSF shall enforce the <i>following rules</i> :
1821		<ul style="list-style-type: none"> <li>• <i>Data received from Meters shall be processed as defined in the corresponding Processing Profiles,</i></li> </ul>
1822		<ul style="list-style-type: none"> <li>• <i>Results of processing of Meter Data shall be submitted to external entities as defined in the Processing Profiles,</i></li> </ul>
1823		<ul style="list-style-type: none"> <li>• <i>The internal system time shall be synchronised as follows:</i></li> </ul>
1824		<ul style="list-style-type: none"> <li> <ul style="list-style-type: none"> <li>○ <i>The TOE shall compare the system time to a reliable external time source every 24 hours</i> <sup>129</sup>.</li> </ul> </li> </ul>
1825		<ul style="list-style-type: none"> <li> <ul style="list-style-type: none"> <li>○ <i>If the deviation between the local time and the remote time is acceptable</i> <sup>130</sup>, <i>the local system time shall be updated according to the remote time.</i></li> </ul> </li> </ul>
1826		<ul style="list-style-type: none"> <li> <ul style="list-style-type: none"> <li>○ <i>If the deviation is not acceptable the TOE shall ensure that any following Meter Data is not used, stop operation</i> <sup>131</sup> <i>and inform a Gateway Administrator</i> <sup>132</sup>.</li> </ul> </li> </ul>
1827		
1828		
1829		
1830		
1831		
1832		
1833		
1834		
1835	FDP_IFF.1.4/MTR	The TSF shall explicitly authorise an information flow based on the following rules: <i>none</i> <sup>133</sup> .
1836		
1837	FDP_IFF.1.5/MTR	The TSF shall explicitly deny an information flow based on the following rules: <i>The TOE shall deny any acceptance of information by external entities in the LMN unless the authenticity, integrity and confidentiality of the Meter Data could be verified</i> <sup>134</sup> .
1838		
1839		
1840		
1841	Hierarchical to:	No other components
1842	Dependencies:	FDP_IFC.1 Subset information flow control
1843		FMT_MSA.3 Static attribute initialisation
1844	<b>Application Note 28:</b>	FDP_IFF.1.3 defines that the TOE shall update the local system time regularly with reliable external time sources if the deviation is acceptable. In the context of this functionality two aspects should be mentioned:
1845		
1846		
1847		<b>Reliability of external source</b>
1848		There are several ways to achieve the reliability of the external source. On
1849		the one hand, there may be a source in the WAN that has an acceptable
1850		reliability on its own (e.g. because it is operated by a very trustworthy
1851		organisation (an official legal time issued by the calibration authority would

<sup>129</sup> [assignment: *synchronization interval between 1 minute and 24 hours*]

<sup>130</sup> Please refer to the following application note for a detailed definition of “acceptable”.

<sup>131</sup> Please note that this refers to the complete functional operation of the TOE and not only to the update of local time. However, an administrative access shall still be possible.

<sup>132</sup> [assignment: *additional information flow control SFP rules*]

<sup>133</sup> [assignment: *rules, based on security attributes, that explicitly authorise information flows*]

<sup>134</sup> [assignment: *rules, based on security attributes, that explicitly deny information flows*]

1852 be a good example for such a source<sup>135</sup>). On the other hand a developer may  
 1853 choose to maintain multiple external sources that all have a certain level of  
 1854 reliability but no absolute reliability. When using such sources the TOE shall  
 1855 contact more than one source and harmonize the results in order to ensure  
 1856 that no attack happened.

1857 **Acceptable deviation**

1858 For the question whether a deviation between the time source(s) in the WAN  
 1859 and the local system time is still acceptable, normative or legislative  
 1860 regulations shall be considered. If no regulation exists, a maximum deviation  
 1861 of 3% of the measuring period is allowed to be in conformance with  
 1862 [PP\_GW]. It should be noted that depending on the kind of application a  
 1863 more accurate system time is needed. For doing so, the intervall for the  
 1864 comparison of the system time to a reliable external time source is  
 1865 configurable. But this aspect is not within the scope of this Security Target.

1866 Please further note that – depending on the exactness of the local clock – it  
 1867 may be required to synchronize the time more often than every 24 hours.

1868 **Application Note 29:** In FDP\_IFF.1.5/MTR the TOE is required to verify the authenticity, integrity  
 1869 and confidentiality of the Meter Data received from the Meter. The TOE has  
 1870 two options to do so:

- 1871 1. To implement a channel between the Meter and the TOE using  
 1872 the functionality as described in FCS\_COP.1/TLS.  
 1873 2. To accept, decrypt and verify data that has been encrypted by  
 1874 the Meter as required in FCS\_COP.1/MTR if a wireless connection  
 1875 to the meters is established.

1876 The latter possibility can be used only if a wireless connection between the  
 1877 Meter and the TOE is established.

1878 **6.5.5 General Requirements on user data protection**

1879 **6.5.5.1 Residual information protection (FDP\_RIP)**

1880 **6.5.5.1.1 FDP\_RIP.2: Full residual information protection**

1881 FDP\_RIP.2.1 The TSF shall ensure that any previous information content of a resource is  
 1882 made unavailable upon the deallocation of the resource from<sup>136</sup> all objects.

1883 Hierarchical to: FDP\_RIP.1 Subset residual information protection

135 By the time that this ST is developed however, this time source is not yet available.

136 [selection: *allocation of the resource to, deallocation of the resource from*]

1884 Dependencies: No dependencies.

1885 **Application Note 30:** Please refer to chapter F.9 of part 2 of [CC] for more detailed information  
 1886 about what kind of information this requirement applies to.

1887 Please further note that this SFR has been used in order to ensure that  
 1888 information that is no longer used is made unavailable from a logical  
 1889 perspective. Specifically, it has to be ensured that this information is not  
 1890 longer available via an external interface (even if an access control or  
 1891 information flow policy would fail). However, this does not necessarily mean  
 1892 that the information is overwritten in a way that makes it impossible for an  
 1893 attacker to get access to is assuming a physical access to the memory of the  
 1894 TOE.

1895 **6.5.5.2 Stored data integrity (FDP\_SDI)**

1896 **6.5.5.2.1 FDP\_SDI.2: Stored data integrity monitoring and action**

1897 FDP\_SDI.2.1 The TSF shall monitor user data stored in containers controlled by the TSF for  
 1898 *integrity errors*<sup>137</sup> on all objects, based on the following attributes:  
 1899 *cryptographical check sum*<sup>138</sup>.

1900 FDP\_SDI.2.2 Upon detection of a data integrity error, the TSF shall *create a system log*  
 1901 *entry*<sup>139</sup>.

1902 Hierarchical to: FDP\_SDI.1 Stored data integrity monitoring

1903 Dependencies: No dependencies.

1904 **6.6 Class FIA: Identification and Authentication**

1905 **6.6.1 User Attribute Definition (FIA\_ATD)**

1906 **6.6.1.1 FIA\_ATD.1: User attribute definition**

1907 FIA\_ATD.1.1 The TSF shall maintain the following list of security attributes belonging to  
 1908 individual users:  
 1909 

- *User Identity*
- *Status of Identity (Authenticated or not)*

  
 1910

137 [assignment: *integrity errors*]

138 [assignment: *user data attributes*]

139 [assignment: *action to be taken*]

- 1911
  - 1912
  - 1913
- *Connecting network (WAN, HAN or LMN)*
  - *Role membership*
  - *none* <sup>140</sup>.

1914 Hierarchical to: No other components.

1915 Dependencies: No dependencies.

## 1916 6.6.2 Authentication Failures (FIA\_AFL)

### 1917 6.6.2.1 FIA\_AFL.1: Authentication failure handling

1918 FIA\_AFL.1.1 The TSF shall detect when 5 <sup>141</sup> unsuccessful authentication attempts occur  
 1919 related to *authentication attempts at IF\_GW\_CON* <sup>142</sup>.

1920 FIA\_AFL.1.2 When the defined number of unsuccessful authentication attempts has been  
 1921 met <sup>143</sup>, the TSF shall *block IF\_GW\_CON for 5 minutes* <sup>144</sup>.

1922 Hierarchical to: No other components

1923 Dependencies: FIA\_UAU.1 Timing of authentication

## 1924 6.6.3 User Authentication (FIA\_UAU)

### 1925 6.6.3.1 FIA\_UAU.2: User authentication before any action

1926 FIA\_UAU.2.1 The TSF shall require each user to be successfully authenticated before  
 1927 allowing any other TSF-mediated actions on behalf of that user.

1928 Hierarchical to: FIA\_UAU.1

1929 Dependencies: FIA\_UID.1 Timing of identification

1930 **Application Note 31:** Please refer to [TR-03109-1] for a more detailed overview on the  
 1931 authentication of TOE users.

140 [assignment: *list of security attributes*]

141 [selection: [assignment: *positive integer number*], an administrator configurable positive integer within [assignment: *range of acceptable values*]]

142 [assignment: *list of authentication events*]

143 [selection: *met, surpassed*]

144 [assignment: *list of actions*]

1932 **6.6.3.2 FIA\_UAU.5: Multiple authentication mechanisms**

- 1933 FIA\_UAU.5.1 The TSF shall provide
- 1934
- 1935
- 1936
- 1937
- 1938
- 1939
- 1940
- 1941
- *authentication via certificates at the IF\_GW\_MTR interface*
  - *TLS-authentication via certificates at the IF\_GW\_WAN interface*
  - *TLS-authentication via HAN-certificates at the IF\_GW\_CON interface*
  - *authentication via password at the IF\_GW\_CON interface*
  - *TLS-authentication via HAN-certificates at the IF\_GW\_SRV interface*
  - *authentication at the IF\_GW\_CLS interface*
  - *verification via a commands' signature* <sup>145</sup>
- to support user authentication.
- 1942 FIA\_UAU.5.2 The TSF shall authenticate any user's claimed identity according to the
- 1943
- 1944
- 1945
- 1946
- 1947
- 1948
- 1949
- 1950
- 1951
- 1952
- 1953
- 1954
- 1955
- *meters shall be authenticated via certificates at the IF\_GW\_MTR interface only*
  - *Gateway Administrators shall be authenticated via TLS-certificates at the IF\_GW\_WAN interface only*
  - *Consumers shall be authenticated via TLS-certificates or via password at the IF\_GW\_CON interface only*
  - *Service Technicians shall be authenticated via TLS-certificates at the IF\_GW\_SRV interface only*
  - *CLS shall be authenticated at the IF\_GW\_CLS only*
  - *each command of an Gateway Administrator shall be authenticated by verification of the commands' signature,*
  - *other external entities shall be authenticated via TLS-certificates at the IF\_GW\_WAN interface only* <sup>146</sup>.
- 1956 Hierarchical to: No other components.
- 1957 Dependencies: No dependencies.
- 1958 **Application Note 32:** Please refer to [TR-03109-1] for a more detailed overview on the
- 1959 authentication of TOE users.

1960 **6.6.3.3 FIA\_UAU.6: Re-authenticating**

- 1961 FIA\_UAU.6.1 The TSF shall re-authenticate **an external entity** <sup>147</sup> under the conditions
- 1962
- *TLS channel to the WAN shall be disconnected after 48 hours,*

145 [assignment: *list of multiple authentication mechanisms*]

146 [assignment: *rules describing how the multiple authentication mechanisms provide authentication*]

147 [refinement: *the user*]

- 1963
- 1964
- 1965
- 1966
- *TLS channel to the LMN shall be disconnected after 5 MB of transmitted information,*
  - *other local users shall be re-authenticated after at least 10 minutes<sup>148</sup> of inactivity<sup>149</sup>.*
- 1967 *Hierarchical to:* *No other components.*
- 1968 *Dependencies:* *No dependencies.*
- 1969 **Application Note 33:** This requirement on re-authentication for external entities in the WAN and
- 1970 LMN is addressed by disconnecting the TLS channel even though a re-
- 1971 authentication is - strictly speaking - only achieved if the TLS channel is build
- 1972 up again.

## 1973 6.6.4 User identification (FIA\_UID)

### 1974 6.6.4.1 FIA\_UID.2: User identification before any action

- 1975 FIA\_UID.2.1 The TSF shall require each user to be successfully identified before allowing
- 1976 any other TSF-mediated actions on behalf of that user.
- 1977 *Hierarchical to:* FIA\_UID.1
- 1978 *Dependencies:* No dependencies.

## 1979 6.6.5 User-subject binding (FIA\_USB)

### 1980 6.6.5.1 FIA\_USB.1: User-subject binding

- 1981 FIA\_USB.1.1 The TSF shall associate the following user security attributes with subjects
- 1982 acting on the behalf of that user: *attributes as defined in FIA\_ATD.1<sup>150</sup>.*
- 1983 FIA\_USB.1.2 The TSF shall enforce the following rules on the initial association of user
- 1984 security attributes with subjects acting on the behalf of users:
- *The initial value of the security attribute 'connecting network' is set to the corresponding physical interface of the TOE (HAN, WAN, or LMN).*
  - *The initial value of the security attribute 'role membership' is set to the user role claimed on basis of the credentials used for authentication at the connecting network as defined in FIA\_UAU.5.2. For role membership 'Gateway Administrators', additionally the*

<sup>148</sup> [refinement: *after at least 10 minutes*]. This value is configurable by the authorised Gateway Administrator.

<sup>149</sup> [assignment: *list of conditions under which re-authentication is required*]

<sup>150</sup> [assignment: *list of user security attributes*]

1991		<i>remote network endpoint</i> <sup>151</sup> <i>used and configured in the TSF data must be identical.</i>
1992		
1993		<ul style="list-style-type: none"> <li>• <i>The initial value of the security attribute ‘user identity’ is set to the identification attribute of the credentials used by the subject. The security attribute ‘user identity’ is set to the subject key ID of the certificate in case of a certificate-based authentication, the meter-ID for wired Meters and the user name owner in case of a password-based authentication at interface IF_GW_CON.</i></li> </ul>
1994		
1995		
1996		
1997		
1998		
1999		<ul style="list-style-type: none"> <li>• <i>The initial value of the security attribute ‘status of identity’ is set to the authentication status of the claimed identity. If the authentication is successful on basis of the used credentials, the status of identity is ‘authenticated’, otherwise it is ‘not authenticated’</i><sup>152</sup>.</li> </ul>
2000		
2001		
2002		
2003	FIA_USB.1.3	The TSF shall enforce the following rules governing changes to the user security attributes associated with subjects acting on the behalf of users:
2004		
2005		<ul style="list-style-type: none"> <li>• <i>security attribute ‘connecting network’ is not changeable.</i></li> </ul>
2006		<ul style="list-style-type: none"> <li>• <i>security attribute ‘role membership’ is not changeable.</i></li> </ul>
2007		<ul style="list-style-type: none"> <li>• <i>security attribute ‘user identity’ is not changeable.</i></li> </ul>
2008		<ul style="list-style-type: none"> <li>• <i>security attribute ‘status of identity’ is not changeable</i><sup>153</sup>.</li> </ul>
2009	Hierarchical to:	No other components.
2010	Dependencies:	FIA_ATD.1 User attribute definition

151 The remote network endpoint can be either the remote IP address or the remote host name.

152 [assignment: *rules for the initial association of attributes*]

153 [assignment: *rules for the changing of attributes*]

2011 **6.7 Class FMT: Security Management**

2012 **6.7.1 Management of the TSF**

2013 **6.7.1.1 Management of functions in TSF (FMT\_MOF)**

2014 **6.7.1.1.1 FMT\_MOF.1: Management of security functions behaviour**

- 2015 FMT\_MOF.1.1 The TSF shall restrict the ability to modify the behaviour of<sup>154</sup> the functions
- 2016 *for management as defined in FMT\_SMF.1*<sup>155</sup> to roles and criteria as defined
- 2017 *in Table 13*<sup>156</sup>.
- 2018 Hierarchical to: No other components.
- 2019 Dependencies: FMT\_SMR.1 Security roles
- 2020 FMT\_SMF.1 Specification of Management Functions

Function	Limitation
Display the version number of the TOE Display the current time	The management functions must only be accessible for an authorised Consumer and only via the interface IF_GW_CON. <b>An authorized Service Technician is also able to access the version number of the TOE and the current time of the TOE via interface IF_GW_SRV</b> <sup>157</sup> .
All other management functions as defined in FMT_SMF.1	The management functions must only be accessible for an authorised Gateway Administrator and only via the interface IF_GW_WAN <sup>158</sup> .
Firmware Update	The firmware update must only be possible after the authenticity of the firmware update has been verified (using the services of the Security Module and the trust anchor of the Gateway developer) and if the version number of the new firmware is higher to the version of the installed firmware.
Deletion or modification of events from the Calibration Log	A deletion or modification of events from the calibration log must not be possible.

2021 **Table 13: Restrictions on Management Functions**

154 [selection: *determine the behaviour of, disable, enable, modify the behaviour of*]

155 [assignment: *list of functions*]

156 [assignment: *the authorised identified roles*]

157 The TOE displays the version number of the TOE and the current time of the TOE also to the authorized service technician via the interface IF\_GW\_SRV because the service technician must be able to determine if the current time of the TOE is correct or if the version number of the TOE is correct.

158 This criterion applies to all management functions. The following entries in this table only augment this restriction further.

2022 **6.7.1.2 Specification of Management Functions (FMT\_SMF)**

2023 **6.7.1.2.1 FMT\_SMF.1: Specification of Management Functions**

- 2024 FMT\_SMF.1.1 The TSF shall be capable of performing the following management functions:
- 2025 *list of management functions as defined in Table 14 and Table 15 and*
- 2026 *additional functionalities: none*<sup>159</sup>.
- 2027 Hierarchical to: No other components.
- 2028 Dependencies: No dependencies.

Displaying the current time
Management of certificates of external entities in the WAN for communication
Resetting of the TOE <sup>175</sup>

2030 **Table 15: Gateway specific Management Functionalities**

2031 **6.7.2 Security management roles (FMT\_SMR)**

2032 **6.7.2.1 FMT\_SMR.1: Security roles**

- 2033 FMT\_SMR.1.1 The TSF shall maintain the roles *authorised Consumer, authorised Gateway Administrator, authorised Service Technician, the authorised identified roles: authorised external entity, CLS, and Meter*<sup>176</sup>.
- 2034
- 2035
- 2036 FMT\_SMR.1.2 The TSF shall be able to associate users with roles.
- 2037 Hierarchical to: No other components.
- 2038 Dependencies: No dependencies.

171 As the rules for TSF testing are fixed within [PP\_GW], the management functions as defined by [CC, part 2] do not apply.

172 As the configuration of the actions that require a trusted channel is fixed by [PP\_GW], the management functions as defined in [CC, part 2] do not apply.

173 As the configuration of the actions that require a trusted channel is fixed by [PP\_GW], the management functions as defined in [CC, part 2] do not apply.

174 As the configuration of the actions that require a trusted channel is fixed by [PP\_GW], the management functions as defined in [CC, part 2] do not apply.

175 Resetting the TOE will be necessary when the TOE stopped operation due to a critical deviation between local and remote time (see FDP\_IFF.1.3/MTR) ~~or when the calibration log is full.~~

176 [assignment: *the authorised identified roles*]

## 2039 **6.7.3 Management of security attributes for Gateway access SFP**

### 2040 **6.7.3.1 Management of security attributes (FMT\_MSA)**

#### 2041 **6.7.3.1.1 FMT\_MSA.1/AC: Management of security attributes for Gateway access**

##### 2042 **SFP**

2043 FMT\_MSA.1.1/AC The TSF shall enforce the *Gateway access SFP*<sup>177</sup> to restrict the ability to  
 2044 query, modify, delete, other operations: none<sup>178</sup> the security attributes *all*  
 2045 *relevant security attributes*<sup>179</sup> to *authorised Gateway Administrators*<sup>180</sup>.

2046 Hierarchical to: No other components.

2047 Dependencies: [FDP\_ACC.1 Subset access control, or  
 2048 FDP\_IFC.1 Subset information flow control], fulfilled by FDP\_ACC.2  
 2049 FMT\_SMR.1 Security roles  
 2050 FMT\_SMF.1 Specification of Management Functions

#### 2051 **6.7.3.1.2 FMT\_MSA.3/AC: Static attribute initialisation for Gateway access SFP**

2052 FMT\_MSA.3.1/AC The TSF shall enforce the *Gateway access SFP*<sup>181</sup> to provide restrictive<sup>182</sup>  
 2053 default values for security attributes that are used to enforce the SFP.

2054 FMT\_MSA.3.2/AC The TSF shall allow the *no role*<sup>183</sup> to specify alternative initial values to  
 2055 override the default values when an object or information is created.

2056 Hierarchical to: No other components.

2057 Dependencies: FMT\_MSA.1 Management of security attributes  
 2058 FMT\_SMR.1 Security roles

---

177 [assignment: *access control SFP(s), information flow control SFP(s)*]

178 [selection: *change\_default, query, modify, delete, [assignment: other operations]*]

179 [assignment: *list of security attributes*]

180 [assignment: *the authorised identified roles*]

181 [assignment: *access control SFP, information flow control SFP*]

182 [selection, choose one of: *restrictive, permissive, [assignment: other property]*]

183 [assignment: *the authorised identified roles*]

---

2059 **6.7.4 Management of security attributes for Firewall SFP**

2060 **6.7.4.1 Management of security attributes (FMT\_MSA)**

2061 **6.7.4.1.1 FMT\_MSA.1/FW: Management of security attributes for firewall policy**

2062 FMT\_MSA.1.1/FW The TSF shall enforce the *Firewall SFP*<sup>184</sup> to restrict the ability to query, modify, delete, other operations: none<sup>185</sup> the security attributes *all relevant security attributes*<sup>186</sup> to *authorised Gateway Administrators*<sup>187</sup>.

2065 Hierarchical to: No other components.

2066 Dependencies: [FDP\_ACC.1 Subset access control, or  
 2067 FDP\_IFC.1 Subset information flow control], fulfilled by FDP\_IFC.2/FW  
 2068 FMT\_SMR.1 Security roles  
 2069 FMT\_SMF.1 Specification of Management Functions

2070 **6.7.4.1.2 FMT\_MSA.3/FW: Static attribute initialisation for Firewall policy**

2071 FMT\_MSA.3.1/FW The TSF shall enforce the *Firewall SFP*<sup>188</sup> to provide restrictive<sup>189</sup> default values for security attributes that are used to enforce the SFP.

2073 FMT\_MSA.3.2/FW The TSF shall allow the *no role*<sup>190</sup> to specify alternative initial values to override the default values when an object or information is created.

2075 Hierarchical to: No other components.

2076 Dependencies: FMT\_MSA.1 Management of security attributes  
 2077 FMT\_SMR.1 Security roles

2078 **Application Note 34:** The definition of restrictive default rules for the firewall information flow policy refers to the rules as defined in FDP\_IFF.1.2/FW and FDP\_IFF.1.5/FW.  
 2079 Those rules apply to all information flows and must not be overwritable by  
 2080 anybody.  
 2081

184 [assignment: *access control SFP(s), information flow control SFP(s)*]

185 [selection: *change\_default, query, modify, delete, [assignment: other operations]*]

186 [assignment: *list of security attributes*]

187 [assignment: *the authorised identified roles*]

188 [assignment: *access control SFP, information flow control SFP*]

189 [selection, choose one of: *restrictive, permissive, [assignment: other property]*]

190 [assignment: *the authorised identified roles*]

2082 **6.7.5 Management of security attributes for Meter SFP**

2083 **6.7.5.1 Management of security attributes (FMT\_MSA)**

2084 **6.7.5.1.1 FMT\_MSA.1/MTR: Management of security attributes for Meter policy**

2085 FMT\_MSA.1.1/MTR The TSF shall enforce the *Meter SFP*<sup>191</sup> to restrict the ability to  
 2086 change default, query, modify, delete, other operations: none<sup>192</sup> the  
 2087 security attributes *all relevant security attributes*<sup>193</sup> to *authorised Gateway*  
 2088 *Administrators*<sup>194</sup>.

2089 Hierarchical to: No other components.

2090 Dependencies: [FDP\_ACC.1 Subset access control, or  
 2091 FDP\_IFC.1 Subset information flow control], fulfilled by FDP\_IFC.2/FW  
 2092 FMT\_SMR.1 Security roles  
 2093 FMT\_SMF.1 Specification of Management Functions

2094 **6.7.5.1.2 FMT\_MSA.3/MTR: Static attribute initialisation for Meter policy**

2095 FMT\_MSA.3.1/MTR The TSF shall enforce the *Meter SFP*<sup>195</sup> to provide restrictive<sup>196</sup> default  
 2096 values for security attributes that are used to enforce the SFP.

2097 FMT\_MSA.3.2/MTR The TSF shall allow the *no role*<sup>197</sup> to specify alternative initial values to  
 2098 override the default values when an object or information is created.

2099 Hierarchical to: No other components.

2100 Dependencies: FMT\_MSA.1 Management of security attributes  
 2101 FMT\_SMR.1 Security roles

---

191 [assignment: *access control SFP(s), information flow control SFP(s)*]

192 [selection: *change\_default, query, modify, delete, [assignment: other operations]*]

193 [assignment: *list of security attributes*]

194 [assignment: *the authorised identified roles*]

195 [assignment: *access control SFP, information flow control SFP*]

196 [selection, choose one of: *restrictive, permissive, [assignment: other property]*]

197 [assignment: *the authorised identified roles*]

---

2102 **6.8 Class FPR: Privacy**

2103 **6.8.1 Communication Concealing (FPR\_CON)**

2104 **6.8.1.1 FPR\_CON.1: Communication Concealing**

- 2105 FPR\_CON.1.1 The TSF shall enforce the *Firewall SFP*<sup>198</sup> in order to ensure that no
- 2106 personally identifiable information (PII) can be obtained by an analysis of
- 2107 *frequency, load, size or the absence of external communication*<sup>199</sup>.
- 2108 FPR\_CON.1.2 The TSF shall connect to *the Gateway Administrator, authorized External*
- 2109 *Entity in the WAN*<sup>200</sup> in intervals as follows daily, other interval: none<sup>201</sup> to
- 2110 conceal the data flow<sup>202</sup>.
- 2111 Hierarchical to: No other components.
- 2112 Dependencies: No dependencies.

2113 **6.8.2 Pseudonymity (FPR\_PSE)**

2114 **6.8.2.1 FPR\_PSE.1 Pseudonymity**

- 2115 FPR\_PSE.1.1 The TSF shall ensure that *external entities in the WAN*<sup>203</sup> are unable to
- 2116 determine the real user name bound to *information neither relevant for*
- 2117 *billing nor for a secure operation of the Grid sent to parties in the WAN*<sup>204</sup>.
- 2118 FPR\_PSE.1.2 The TSF shall be able to provide *aliases as defined by the Processing*
- 2119 *Profiles*<sup>205</sup> ~~of the real user name for the Meter and Gateway identity~~<sup>206</sup> to
- 2120 *external entities in the WAN*<sup>207</sup>.
- 2121 FPR\_PSE.1.3 The TSF shall determine an alias for a user<sup>208</sup> and verify that it conforms to
- 2122 the *alias given by the Gateway Administrator in the Processing Profile*<sup>209</sup>.

- 198 [assignment: *information flow policy*]
- 199 [assignment: *characteristics of the information flow that need to be concealed*]
- 200 [assignment: *list of external entities*]
- 201 [selection: *weekly, daily, hourly, [assignment: other interval]*]
- 202 The TOE uses a randomized value of about ±50 percent per delivery.
- 203 [assignment: *set of users and/or subjects*]
- 204 [assignment: *list of subjects and/or operations and/or objects*]
- 205 [assignment: *number of aliases*]
- 206 [refinement: *of the real user name*]
- 207 [assignment: *list of subjects*]
- 208 [selection, choose one of: *determine an alias for a user, accept the alias from the user*]

---

2123	Hierarchical to:	No other components.
2124	Dependencies:	No dependencies.
2125	<b>Application Note 35:</b>	When the TOE submits information about the consumption or production of
2126		a certain commodity that is not relevant for the billing process nor for a
2127		secure operation of the Grid, there is no need that this information is sent
2128		with a direct link to the identity of the consumer. In those cases, the TOE
2129		shall replace the identity of the Consumer by a pseudonymous identifier.
2130		Please note that the identity of the Consumer may not be their name but
2131		could also be a number (e.g. consumer ID) used for billing purposes.
2132		A Gateway may use more than one pseudonymous identifier.
2133		A complete anonymisation would be beneficial in terms of the privacy of the
2134		consumer. However, a complete anonymous set of information would not
2135		allow the external entity to ensure that the data comes from a trustworthy
2136		source.
2137		Please note that an information flow shall only be initiated if allowed by a
2138		corresponding Processing Profile.

## 2139 6.9 Class FPT: Protection of the TSF

### 2140 6.9.1 Fail secure (FPT\_FLS)

#### 2141 6.9.1.1 FPT\_FLS.1: Failure with preservation of secure state

2142	FPT_FLS.1.1	The TSF shall preserve a secure state when the following types of failures
2143		occur:
2144		<ul style="list-style-type: none"> <li>• <i>the deviation between local system time of the TOE and the reliable</i></li> </ul>
2145		<i>external time source is too large,</i>
2146		<ul style="list-style-type: none"> <li>• <i>TOE hardware / firmware integrity violation or</i></li> </ul>
2147		<ul style="list-style-type: none"> <li>• <i>TOE software application integrity violation</i> <sup>210</sup>.</li> </ul>
2148	Hierarchical to:	No other components.
2149	Dependencies:	No dependencies.
2150	<b>Application Note 36:</b>	The local clock shall be as exact as required by normative or legislative
2151		regulations. If no regulation exists, a maximum deviation of 3% of the
2152		measuring period is allowed to be in conformance with [PP_GW].

---

209 [assignment: *alias metric*]

210 [assignment: *list of types of failures in the TSF*]

---

## 2153 6.9.2 Replay Detection (FPT\_RPL)

### 2154 6.9.2.1 FPT\_RPL.1: Replay detection

2155 FPT\_RPL.1.1 The TSF shall detect replay for the following entities: *all external entities* <sup>211</sup>.

2156 FPT\_RPL.1.2 The TSF shall perform *ignore replayed data* <sup>212</sup> when replay is detected.

2157 Hierarchical to: No other components.

2158 Dependencies: No dependencies.

## 2159 6.9.3 Time stamps (FPT\_STM)

### 2160 6.9.3.1 FPT\_STM.1: Reliable time stamps

2161 FPT\_STM.1.1 The TSF shall be able to provide reliable time stamps.

2162 Hierarchical to: No other components.

2163 Dependencies: No dependencies.

2164

2165

## 2166 6.9.4 TSF self test (FPT\_TST)

### 2167 6.9.4.1 FPT\_TST.1: TSF testing

2168 FPT\_TST.1.1 The TSF shall run a suite of self tests during initial startup, at the request of a  
 2169 user and periodically during normal operation <sup>213</sup> to demonstrate the correct  
 2170 operation of the TSF <sup>214</sup>.

2171 FPT\_TST.1.2 The TSF shall provide authorised users with the capability to verify the  
 2172 integrity of TSF data <sup>215</sup>.

2173 FPT\_TST.1.3 The TSF shall provide authorised users with the capability to verify the  
 2174 integrity of TSF <sup>216</sup>.

2175 Hierarchical to: No other components .

---

211 [assignment: *list of identified entities*]

212 [assignment: *list of specific actions*]

213 [selection: *during initial start-up, periodically during normal operation, at the request of the authorised user, at the conditions[assignment: conditions under which self test should occur]*]

214 [selection: *[assignment: parts of TSF], the TSF*]

215 [selection: *[assignment: parts of TSF data], TSF data*]

216 [selection: *[assignment: parts of TSF], TSF*]

---

2176 Dependencies: No dependencies.

## 2177 6.9.5 TSF physical protection (FPT\_PHP)

### 2178 6.9.5.1 FPT\_PHP.1: Passive detection of physical attack

2179 FPT\_PHP.1.1 The TSF shall provide unambiguous detection of physical tampering that  
2180 might compromise the TSF.

2181 FPT\_PHP.1.2 The TSF shall provide the capability to determine whether physical tampering  
2182 with the TSF's devices or TSF elements has occurred.

2183 Hierarchical to: No other components.

2184 Dependencies: No dependencies.

## 2185 6.10 Class FTP: Trusted path/channels

### 2186 6.10.1 Inter-TSF trusted channel (FTP\_ITC)

#### 2187 6.10.1.1 FTP\_ITC.1/WAN: Inter-TSF trusted channel for WAN

2188 FTP\_ITC.1.1/WAN The TSF shall provide a communication channel between itself and another  
2189 trusted IT product that is logically distinct from other communication  
2190 channels and provides assured identification of its end points and protection  
2191 of the channel data from modification or disclosure.

2192 FTP\_ITC.1.2/WAN The TSF shall permit the TSF<sup>217</sup> to initiate communication via the trusted  
2193 channel.

2194 FTP\_ITC.1.3/WAN The TSF shall initiate communication via the trusted channel for *all*  
2195 *communications to external entities in the WAN*<sup>218</sup>.

2196 Hierarchical to: No other components

2197 Dependencies: No dependencies.

#### 2198 6.10.1.2 FTP\_ITC.1/MTR: Inter-TSF trusted channel for Meter

2199 FTP\_ITC.1.1/MTR The TSF shall provide a communication channel between itself and another  
2200 trusted IT product that is logically distinct from other communication

---

217 [selection: *the TSF, another trusted IT product*]

218 [assignment: *list of functions for which a trusted channel is required*]

---

- 2201 channels and provides assured identification of its end points and protection
- 2202 of the channel data from modification or disclosure.
- 2203 FTP\_ITC.1.2/MTR The TSF shall permit **the Meter and the TOE** <sup>219</sup> to initiate communication via
- 2204 the trusted channel.
- 2205 FTP\_ITC.1.3/MTR The TSF shall initiate communication via the trusted channel for *any*
- 2206 *communication between a Meter and the TOE* <sup>220</sup>.
- 2207 Hierarchical to: No other components.
- 2208 Dependencies: No dependencies.
- 2209 **Application Note 37:** The corresponding cryptographic primitives are defined by FCS\_COP.1/MTR.

2210 **6.10.1.3 FTP\_ITC.1/USR: Inter-TSF trusted channel for User**

- 2211 FTP\_ITC.1.1/USR The TSF shall provide a communication channel between itself and another
- 2212 trusted IT product that is logically distinct from other communication
- 2213 channels and provides assured identification of its end points and protection
- 2214 of the channel data from modification or disclosure.
- 2215 FTP\_ITC.1.2/USR The TSF shall permit **the Consumer, the Service Technician** <sup>221</sup> to initiate
- 2216 communication via the trusted channel.
- 2217 FTP\_ITC.1.3/USR The TSF shall initiate communication via the trusted channel for *any*
- 2218 *communication between a Consumer and the TOE and the Service Technician*
- 2219 *and the TOE* <sup>222</sup>.
- 2220 Hierarchical to: No other components.
- 2221 Dependencies: No dependencies.

2222 **6.11 Security Assurance Requirements for the TOE**

- 2223 The minimum Evaluation Assurance Level for this Security Target is **EAL 4 augmented by AVA\_VAN.5**
- 2224 **and ALC\_FLR.2**. The following table lists the assurance components which are therefore applicable to
- 2225 this ST.

- 219 [selection: *the TSF, another trusted IT product*]
- 220 [assignment: *list of functions for which a trusted channel is required*]
- 221 [selection: *the TSF, another trusted IT product*]
- 222 [assignment: *list of functions for which a trusted channel is required*]

2227 **6.12 Security Requirements rationale**

2228 **6.12.1 Security Functional Requirements rationale**

2229 **6.12.1.1 Fulfilment of the Security Objectives**

2230 This chapter proves that the set of security requirements (TOE) is suited to fulfil the security  
 2231 objectives described in chapter 4 and that each SFR can be traced back to the security objectives. At  
 2232 least one security objective exists for each security requirement.

2233 **Table 17: Fulfilment of Security Objectives**

2234 The following paragraphs contain more details on this mapping.

2235 **6.12.1.1.1 O.Firewall**

2236 O.Firewall is met by a combination of the following SFRs:

- 2237 • **FDP\_IFC.2/FW** defines that the TOE shall implement an information flow policy for its
- 2238 firewall functionality.
- 2239 • **FDP\_IFF.1/FW** defines the concrete rules for the firewall information flow policy.
- 2240 • **FTP\_ITC.1/WAN** defines the policy around the trusted channel to parties in the WAN.

2241 **6.12.1.1.2 O.SeparateIF**

2242 O.SeparateIF is met by a combination of the following SFRs:

- 2243 • **FDP\_IFC.2/FW** and **FDP\_IFF.1/FW** implicitly require the TOE to implement physically
- 2244 separate ports for WAN and LMN.
- 2245 • **FPT\_TST.1** implements a self test that also detects whether the ports for WAN and LAN have
- 2246 been interchanged.

---

2247 **6.12.1.1.3 O.Conceal**

2248 O.Conceal is completely met by **FPR\_CON.1** as directly follows.

2249 **6.12.1.1.4 O.Meter**

2250 O.Meter is met by a combination of the following SFRs:

- 2251 • **FDP\_IFC.2/MTR** and **FDP\_IFF.1/MTR** define an information flow policy to introduce how the  
2252 Gateway shall handle Meter Data.
- 2253 • **FCO\_NRO.2** ensure that all Meter Data will be signed by the Gateway (invoking the services  
2254 of its Security Module) before being submitted to external entities.
- 2255 • **FPR\_PSE.1** defines requirements around the pseudonymization of Meter identities for Status  
2256 data.
- 2257 • **FTP\_ITC.1/MTR** defines the requirements around the Trusted Channel that shall be  
2258 implemented by the Gateway in order to protect information submitted via the Gateway and  
2259 external entities in the WAN or the Gateway and a distributed Meter.

2260 **6.12.1.1.5 O.Crypt**

2261 O.Crypt is met by a combination of the following SFRs:

- 2262 • **FCS\_CKM.4** defines the requirements around the secure deletion of ephemeral  
2263 cryptographic keys.
  - 2264 • **FCS\_CKM.1/TLS** defines the requirements on key negotiation for the TLS protocol.
  - 2265 • **FCS\_CKM.1/CMS** defines the requirements on key generation for symmetric encryption  
2266 within CMS.
  - 2267 • **FCS\_COP.1/TLS** defines the requirements around the encryption and decryption capabilities  
2268 of the Gateway for communications with external parties and to Meters.
  - 2269 • **FCS\_COP.1/CMS** defines the requirements around the encryption and decryption of content  
2270 and administration data.
-

- 
- 2271       • **FCS\_CKM.1/MTR** defines the requirements on key negotiation for meter communication  
2272        encryption.
- 2273       • **FCS\_COP.1/MTR** defines the cryptographic primitives for meter communication encryption.
- 2274       • **FCS\_COP.1/HASH** defines the requirements on hashing that are needed in the context of  
2275        digital signatures (which are created and verified by the Security Module).
- 2276       • **FCS\_COP.1/MEM** defines the requirements around the encryption of TSF data.
- 2277       • **FPT\_RPL.1** ensures that a replay attack for communications with external entities is detected.

2278    **6.12.1.1.6    O.Time**

2279    O.Time is met by a combination of the following SFRs:

- 2280       • **FDP\_IFC.2/MTR** and **FDP\_IFF.1/MTR** define the required update functionality for the local  
2281        time as part of the information flow control policy for handling Meter Data.
- 2282       • **FPT\_STM.1** defines that the TOE shall be able to provide reliable time stamps.

2283    **6.12.1.1.7    O.Protect**

2284    O.Protect is met by a combination of the following SFRs:

- 2285       • **FCS\_COP.1/MEM** defines that the TOE shall encrypt its TSF and user data as long as it is not  
2286        in use.
- 2287       • **FDP\_RIP.2** defines that the TOE shall make information unavailable as soon as it is no longer  
2288        needed.
- 2289       • **FDP\_SDI.2** defines requirements around the integrity protection for stored data.
- 2290       • **FPT\_FLS.1** defines requirements that the TOE falls back to a safe state for specific error cases.
- 2291       • **FPT\_TST.1** defines the self testing functionality to detect whether the interfaces for WAN and  
2292        LAN are separate.
- 2293       • **FPT\_PHP.1** defines the exact requirements around the physical protection that the TOE has  
2294        to provide.

---

2295 **6.12.1.1.8 O.Management**

2296 O.Management is met by a combination of the following SFRs:

- 2297 • **FIA\_ATD.1** defines the attributes for users.
- 2298 • **FIA\_AFL.1** defines the requirements if the authentication of users fails multiple times.
- 2299 • **FIA\_UAU.2** defines requirements around the authentication of users.
- 2300 • **FIA\_UID.2** defines requirements around the identification of users.
- 2301 • **FIA\_USB.1** defines that the TOE must be able to associate users with subjects acting on
- 2302 behalf of them.
- 2303 • **FMT\_MOF.1** defines requirements around the limitations for management of security
- 2304 functions.
- 2305 • **FMT\_MSA.1/AC** defines requirements around the limitations for management of attributes
- 2306 used for the Gateway access SFP.
- 2307 • **FMT\_MSA.1/FW** defines requirements around the limitations for management of attributes
- 2308 used for the Firewall SFP.
- 2309 • **FMT\_MSA.1/MTR** defines requirements around the limitations for management of
- 2310 attributes used for the Meter SFP.
- 2311 • **FMT\_MSA.3/AC** defines the default values for the Gateway access SFP.
- 2312 • **FMT\_MSA.3/FW** defines the default values for the Firewall SFP.
- 2313 • **FMT\_MSA.3/MTR** defines the default values for the Meter SFP.
- 2314 • **FMT\_SMF.1** defines the management functionalities that the TOE must offer.
- 2315 • **FMT\_SMR.1** defines the role concept for the TOE.

2316 **6.12.1.1.9 O.Log**

2317 O.Log defines that the TOE shall implement three different audit processes that are covered by the

2318 Security Functional Requirements as follows:

---

2319 **System Log**

2320 The implementation of the system log itself is covered by the use of **FAU\_GEN.1/SYS**.  
2321 **FAU\_ARP.1/SYS** and **FAU\_SAA.1/SYS** allow to define a set of criteria for automated analysis of the  
2322 audit and a corresponding response. **FAU\_SAR.1/SYS** defines the requirements around the audit  
2323 review functions and that access to them shall be limited to authorised Gateway Administrators via  
2324 the IF\_GW\_WAN interface and to authorised Service Technicians via the IF\_GW\_SRV interface.  
2325 Finally, **FAU\_STG.4/SYS** defines the requirements on what should happen if the audit log is full.

2326 **Consumer Log**

2327 The implementation of the consumer log itself is covered by the use of **FAU\_GEN.1/CON**.  
2328 **FAU\_STG.4/CON** defines the requirements on what should happen if the audit log is full.  
2329 **FAU\_SAR.1/CON** defines the requirements around the audit review functions for the consumer log  
2330 and that access to them shall be limited to authorised Consumer via the IF\_GW\_CON interface.  
2331 **FPT\_ITC.1/USR** defines the requirements on the protection of the communication of the Consumer  
2332 with the TOE.

2333 **Calibration Log**

2334 The implementation of the calibration log itself is covered by the use of **FAU\_GEN.1/CAL**.  
2335 **FAU\_STG.4/CAL** defines the requirements on what should happen if the audit log is full.  
2336 **FAU\_SAR.1/CAL** defines the requirements around the audit review functions for the calibration log  
2337 and that access to them shall be limited to authorised Gateway Administrators via the IF\_GW\_WAN  
2338 interface.

2339 **FAU\_GEN.2**, **FAU\_STG.2** and **FPT\_STM.1** apply to all three audit processes.

2340 **6.12.1.1.10 O.Access**2341 **FDP\_ACC.2** and **FDP\_ACF.1** define the access control policy as required to address O.Access.2342 **FIA\_UAU.5** ensures that entities that would like to communicate with the TOE are authenticated2343 before any action whereby **FIA\_UAU.6** ensures that external entities in the WAN are re-

2344 authenticated after the session key has been used for a certain amount of time.

2345 **6.12.1.2 Fulfilment of the dependencies**

2346 The following table summarises all TOE functional requirements dependencies of this ST and

2347 demonstrates that they are fulfilled.

SFR	Dependencies	Fulfilled by
FAU_ARP.1/SYS	FAU_SAA.1 Potential violation analysis	FAU_SAA.1/SYS
FAU_GEN.1/SYS	FPT_STM.1 Reliable time stamps	FPT_STM.1
FAU_SAA.1/SYS	FAU_GEN.1 Audit data generation	FAU_GEN.1/SYS
FAU_SAR.1/SYS	FAU_GEN.1 Audit data generation	FAU_GEN.1/SYS
FAU_STG.4/SYS	FAU_STG.1 Protected audit trail storage	FAU_STG.2
FAU_GEN.1/CON	FPT_STM.1 Reliable time stamps	FPT_STM.1
FAU_SAR.1/CON	FAU_GEN.1 Audit data generation	FAU_GEN.1/CON
FAU_STG.4/CON	FAU_STG.1 Protected audit trail storage	FAU_STG.2
FAU_GEN.1/CAL	FPT_STM.1 Reliable time stamps	FPT_STM.1
FAU_SAR.1/CAL	FAU_GEN.1 Audit data generation	FAU_GEN.1/CAL
FAU_STG.4/CAL	FAU_STG.1 Protected audit trail storage	FAU_STG.2
FAU_GEN.2	FAU_GEN.1 Audit data generation FIA_UID.1 Timing of identification	FAU_GEN.1/SYS FAU_GEN.1/CON FIA_UID.2

2348

Table 18: SFR Dependencies

---

2349           **6.12.1.3 Justification for missing dependencies**

2350           Dependency FCS\_CKM.1 for FCS\_COP.1/MEM ist not fulfilled. For the key generation process an  
2351           external security module (“D-HSM”) is used so that the key is imported from an HSM during TOE  
2352           production.

2353           The hash algorithm as defined in FCS\_COP.1/HASH does not need any key material. As such the  
2354           dependency to an import or generation of key material is omitted for this SFR.

2355           **6.12.2 Security Assurance Requirements rationale**

2356           The decision on the assurance level has been mainly driven by the assumed attack potential. As  
2357           outlined in the previous chapters of this Security Target it is assumed that – at least from the WAN  
2358           side – a high attack potential is posed against the security functions of the TOE. This leads to the use  
2359           of AVA\_VAN.5 (Resistance against high attack potential).

2360           In order to keep evaluations according to this Security Target commercially feasible EAL 4 has been  
2361           chosen as assurance level as this is the lowest level that provides the prerequisites for the use of  
2362           AVA\_VAN.5.

2363           Eventually, the augmentation by ALC\_FLR.2 has been chosen to emphasize the importance of a  
2364           structured process for flaw remediation at the developer’s side, specifically for such a new  
2365           technology.

2366           **6.12.2.1 Dependencies of assurance components**

2367           The dependencies of the assurance requirements taken from EAL 4 are fulfilled automatically. The  
2368           augmentation by AVA\_VAN.5 and ALC\_FLR.2 does not introduce additional assurance components  
2369           that are not contained in EAL 4.

---

## 2370 7 TOE Summary Specification

2371 The following paragraph provides a TOE summary specification describing how the TOE meets each  
2372 SFR.

### 2373 7.1 SF.1: Authentication of Communication and Role Assignment for 2374 external entities

2375 The TOE contains a software module that authenticates all communication channels with WAN, HAN  
2376 and LMN networks. The authentication is based on the TLS 1.2 protocol compliant to [RFC 5246].  
2377 According to [TR-03109], this TLS authentication mechanism is used for all TLS secured  
2378 communications channels with external entities. The TOE does always implement the bidirectional  
2379 authentication as required by [TR-03109-1] with one exception: if the Consumer requests a  
2380 password-based authentication from the GWA according to [TR-03109-1], and the GWA activates this  
2381 authentication method for this Consumer, the TOE uses a unidirectional TLS authentication. Thus,  
2382 although the client has not sent a valid certificate, the TOE continues the TLS authentication process  
2383 with the password authentication process for this client (see [RFC 5246, chap. 7.4.6.]). The password  
2384 policy to be fulfilled hereby is that the password must be at least 10 characters long containing at  
2385 least one character of each of the following character groups: capital letters, small letters, digits, and  
2386 special characters (!"#\$%&/()=?+\*~#',;:-\_). Further characters could also be used.

2387 [TR-03109-1] requires the TOE to use elliptical curves conforming to [RFC 5289] whereas the  
2388 following cipher suites are supported:

- 2389 • TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_CBC\_SHA256,
- 2390 • TLS\_ECDHE\_ECDSA\_WITH\_AES\_256\_CBC\_SHA384,
- 2391 • TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_GCM\_SHA256, and
- 2392 • TLS\_ECDHE\_ECDSA\_WITH\_AES\_256\_GCM\_SHA384.

2393 The following elliptical curves are supported by the TOE

- 2394 • BrainpoolP256r1 (according to [RFC 5639]),
- 2395 • BrainpoolP384r1 (according to [RFC 5639]),

- 2396 • BrainpoolP512r1 (according to [RFC 5639]),
- 2397 • NIST P-256 (according to [RFC 5114]), and
- 2398 • NIST P-384 (according to [RFC 5114]).

2399 Alongside, the TOE supports the case of unidirectional communication with wireless meter (via the  
2400 wM-Bus protocol), where the external entity is authenticated via AES with CMAC authentication. In  
2401 this case, the AES algorithm is operating in CBC mode with 128-bit symmetric keys. The  
2402 authentication is successful in case that the CMAC has been successfully verified by the use of a  
2403 cryptographic key  $K_{\text{mac}}$ . The cryptographic key for CMAC authentication ( $K_{\text{mac}}$ ) is derived from the  
2404 meter individual key MK conformant to [TR-03116-3, chap. 7.2]. The meter individual key MK  
2405 (brought into the TOE by the GWA) is selected by the TOE through the MAC-protected but  
2406 unencrypted meter-id submitted by the meter.

2407 The generation of the cryptographic key material for TLS secured communication channels utilizes a  
2408 Security Module. This Security Module is compliant to [TR-03109-2] and evaluated according to  
2409 [SecModPP].

2410 The destruction of cryptographic key material used by the TOE is performed through “zeroisation”.  
2411 The TOE stores all ephemeral keys used for TLS secured communication or other cryptographic  
2412 operations in the RAM only. For instance, whenever a TLS secured communication is terminated, the  
2413 TOE wipes the RAM area used for the cryptographic key material with 0-bytes directly after finishing  
2414 the usage of that material.

2415 The TOE receives the authentication certificate of the external entity during the handshake phase of  
2416 the TLS protocol. For the establishment of the TLS secured communication channel, the TOE verifies  
2417 the correctness of the signed data transmitted during the TLS protocol handshake phase. While  
2418 importing an authentication certificate the TOE verifies the certificate chain of the certificate for all  
2419 certificates of the SM-PKI according to [TR-03109-4]. Note, that the certificate used for the TLS-based  
2420 authentication of wired meters is self-signed and not part of the SM-PKI. Additionally, the TOE checks  
2421 whether the certificate is configured by the Gateway Administrator for the used interface, and  
2422 whether the remote IP address used and configured in the TSF data are identical (**FIA\_USB.1**). The

---

2423 TOE does not check the certificate's revocation status. In order to authenticate the external entity,  
2424 the key material of the TOE's communication partner must be known and trusted.

2425 The following communication types are known to the TOE <sup>224</sup>:

- 2426 a) WAN communication via IF\_GW\_WAN
- 2427 b) LMN communication via IF\_GW\_MTR (wireless or wired Meter)
- 2428 c) HAN communication via IF\_GW\_CON, IF\_GW\_CLS or IF\_GW\_SRV

2429 Except the communication with wireless meters at IF\_GW\_MTR, all communication types are TLS-  
2430 based. In order to accept a TLS communication connection as being authenticated, the following  
2431 conditions must be fulfilled:

- 2432 a) The TLS channel must have been established successfully with the required cryptographic  
2433 mechanisms.
- 2434 b) The certificate of the external entity must be known and trusted through configuration by  
2435 the Gateway Administrator, and associated with the according communication type<sup>225</sup>.

2436 For the successfully authenticated external entity, the TOE performs an internal assignment of the  
2437 communication type based on the certificate received at the external interface if applicable. The user  
2438 identity is associated with the name of the certificate owner in case of a certificate-based  
2439 authentication or with the user name in case of a password-based authentication at interface  
2440 IF\_GW\_CON.

2441 For the LMN communication of the TOE with wireless (a.k.a. wM-Bus-based) meters, the external  
2442 entity is authenticated by the use of the AES-CMAC algorithm and the meter-ID for wired Meters is  
2443 used for association to the user identity (**FIA\_USB.1**). This communication is only allowed for meters  
2444 not supporting TLS-based communication scenarios.

2445 **FCS\_CKM.1/TLS** is fulfilled by the TOE through the implementation of the pseudorandom function of  
2446 the TLS protocol compliant to [RFC 5246] while the Security Module is used by the TOE for the  
2447 generation of the cryptographic key material. The use of TLS according to [RFC 5246] and the use of

---

<sup>224</sup> Please note that the TOE additionally offers the interface IF\_GW\_SM to the certified Security Module built into the TOE.

<sup>225</sup> Of course, this does not apply if password-based authentication is configured at IF\_GW\_CON.

---

2448 the postulated cipher suites according to [RFC 5639] fulfill the requirement **FCS\_COP.1/TLS**. The  
2449 requirements **FCS\_CKM.1/MTR** and **FCS\_COP.1/MTR** are fulfilled by the use of AES-CMAC-secured  
2450 communication for wireless meters. The requirement **FCS\_CKM.4** is fulfilled by the described method  
2451 of “zeroisation” when destroying cryptographic key material. The implementation of the described  
2452 mechanisms (especially the use of TLS and AES-CBC with CMAC) fulfills the requirements  
2453 **FTP\_ITC.1/WAN**, **FTP\_ITC.1/MTR**, and **FTP\_ITC.1/USR**. **FPT\_RPL.1** is fulfilled by the use of the TLS  
2454 protocol respectively the integration of transmission counters according to [TR-03116-3, chap. 7.3].

2455 A successfully established connection will be automatically disconnected by the TOE if a TLS channel  
2456 to the WAN is established more than 48 hours, if a TLS channel to the LMN has transmitted more  
2457 than 5 MB of information or if a channel to a local user is inactive for a time configurable by the  
2458 authorised Gateway Administrator of up to 10 minutes, and a new connection establishment will  
2459 require a new full authentication procedure (**FIA\_UAU.6**). In any case – whether the connection has  
2460 been successfully established or not – all associated resources related with the connection or  
2461 connection attempt are freed. The implementation of this requirement is done by means of the  
2462 TOE’s operation system monitoring and limiting the resources of each process. This means that with  
2463 each connection (or connection attempt) an internal session is created that is associated with  
2464 resources monitored and limited by the TOE. All resources are freed even before finishing a session if  
2465 the respective resource is no longer needed so that no previous information content of a resource is  
2466 made available. Especially, the associated cryptographic key material is wiped as soon it is no longer  
2467 needed. As such, the TOE ensures that during the phase of connection termination the internal  
2468 session is also terminated and by this, all internal data (associated cryptographic key material and  
2469 volatile data) is wiped by the zeroisation procedure described. Allocated physical resources are also  
2470 freed. In case non-volatile data is no longer needed, the associated resources data are freed, too. The  
2471 TOE doesn’t reuse any objects after deallocation of the resource (**FDP\_RIP.2**).

2472 If the external entity can be successfully authenticated on basis of the received certificate (or the  
2473 password in case of a consumer using password authentication) and the acclaimed identity could be  
2474 approved for the used external interface, the TOE associates the user identity, the authentication  
2475 status and the connecting network to the role according to the internal role model (**FIA\_ATD.1**). In  
2476 order to implement this, the TOE utilizes an internal data model which supplies the allowed

---

2477 communication network and other restricting properties linked with the submitted security attribute  
2478 on the basis of the submitted authentication data providing the multiple mechanisms for  
2479 authentication of any user's claimed identity according to the necessary rules according to [TR-  
2480 03109-1] (**FIA\_UAU.5**).

2481 In case of wireless meter communication (via the wM-Bus protocol), the security attribute of the  
2482 Meter is the meter-id authenticated by the CMAC, where the meter-id is the identity providing  
2483 criterion that is used by the TOE. The identity of the Meter is associated to the successfully  
2484 authenticated external entity by the TOE and linked to the respective role according to Table 5 and  
2485 its active session. In this case, the identity providing criterion is also the meter-id.

2486 The TOE enforces an explicit and complete security policy protecting the data flow for all external  
2487 entities (**FDP\_IFC.2/FW**, **FDP\_IFF.1/FW**, **FDP\_IFC.2/MTR**, **FDP\_IFF.1/MTR**). The security policy  
2488 defines the accessibility of data for each external entity and additionally the permitted actions for  
2489 these data. Moreover, the external entities do also underlie restrictions for the operations which can  
2490 be executed with the TOE (**FDP\_ACF.1**). In case that it is not possible to authenticate an external  
2491 entity successfully (e.g. caused by unknown authentication credentials), no other action is allowed on  
2492 behalf of this user and the concerning connection is terminated (**FIA\_UAU.2**). Any communication is  
2493 only possible after successful authentication and identification of the external entity (**FIA\_UID.2**,  
2494 **FIA\_USB.1**).

2495 The reception of the wake-up service data package is a special case that requests the TOE to  
2496 establish a TLS authenticated and protected connection to the Gateway Administrator. The TOE  
2497 validates the data package due to its compliance to the structure described in [TR-03109-1] and  
2498 verifies the ECDSA signature with the public key of the Gateway Administrator's certificate which  
2499 must be known and trusted to the TOE. The TOE does not perform a revocation check or any validity  
2500 check compliant to the shell model. The TOE verifies the electronic signature successfully when the  
2501 certificate is known, trusted and associated to the Gateway Administrator. The TOE establishes the  
2502 connection to the Gateway Administrator when the package has been validated due to its structural  
2503 conformity, the signature has been verified and the integrated timestamp fulfills the requirements of

---

---

2504 [TR-03109-1]. Receiving the data package and the successful validation of the wake-up package does  
2505 not mean that the Gateway Administrator has successfully been authenticated.

2506 If the Gateway Administrator could be successfully authenticated based on the certificate submitted  
2507 during the TLS handshake phase, the role will be assigned by the TOE according to now approved  
2508 identity based on the internal role model and the TLS channel will be established.

2509 **WAN roles**

2510 The TOE assigns the following roles in the WAN communication (**FMT\_SMR.1**):

- 2511       • authorised Gateway Administrator,  
2512       • authorised External Entity.

2513 The role assignment is based on the X.509 certificate used by the external entity during TLS  
2514 connection establishment. The TOE has explicit knowledge of the Gateway Administrator's certificate  
2515 and the assignment of the role "Gateway Administrator" requires the successful authentication of  
2516 the WAN connection.

2517 The assignment of the role "Authorized External Entity" requires the X.509 certificate that is used  
2518 during the TLS handshake to be part of an internal trust list that is under control of the TOE.

2519 The role "Authorized External Entity" can be assigned to more than one external entity.

2520 **HAN roles**

2521 The TOE differentiates and assigns the following roles in the HAN communication (**FMT\_SMR.1**):

- 2522       • authorised Consumer  
2523       • authorised Service Technician

2524 The role assignment is based on the X.509 certificate used by the external entity for TLS-secured  
2525 communication channels or on password-based authentication at interface IF\_GW\_CON if configured  
2526 (**FIA\_USB.1**).

2527 The assignment of roles in the HAN communication requires the successful identification of the  
2528 external entity as a result of a successful authentication based on the certificate used for the HAN

---

---

2529 connection. The certificates used to authenticate the “Consumer” or the “Service Technician” are  
2530 explicitly known to the TOE through configuration by the Gateway Administrator.

2531 **Multi-client capability in the HAN**

2532 The HAN communication might use more than one, parallel and independent authenticated  
2533 communication channels. The TOE ensures that the certificates that are used for the authentication  
2534 are different from each other.

2535 The role “Consumer” can be assigned to multiple, parallel sessions. The TOE ensures that these  
2536 parallel sessions are logically distinct from each other by the use of different authentication  
2537 information. This ensures that only the Meter Data associated with the authorized user are provided  
2538 and Meter Data of other users are not accessible.

2539 **LMN roles**

2540 One of the following authentication mechanisms is used for Meters:

- 2541 a) authentication by the use of TLS according to [RFC 5246] for wired Meters
- 2542 a) authentication by the use of AES with CMAC authentication according to [RFC 3394] for  
2543 wireless Meters.

2544 The TOE explicitly knows the identification credentials needed for authentication (X.509 certificate  
2545 when using TLS; meter-id in conjunction with CMAC and known  $K_{mac}$  when using AES) through  
2546 configuration by the Gateway Administrator. If the Meter could be successfully authenticated and  
2547 the claimed identity could thus be proved, the according role “Authorised External Entity” is assigned  
2548 by the TOE for this Meter at IF\_GW\_MTR based on the internal role model.

2549 **LMN multi-client capabilities**

2550 The LMN communication can be run via parallel, logically distinct and separately authenticated  
2551 communication channels. The TOE ensures that the authentication credentials of each separate  
2552 channel are different.

2553 The TOE’s internal policy for access to data and objects under control of the TOE is closely linked with  
2554 the identity of the external entity at IF\_GW\_MTR according to the TOE-internal role model. Based on

---

2555 the successfully verified authentication data, a permission catalogue with security attributes is  
2556 internally assigned, which defines the allowed actions and access permissions within a  
2557 communication channel.

2558 The encapsulation of the TOE processes run by this user is realized through the mechanisms offered  
2559 by the TOE's operating system and very restrictive user rights for each process. Each role is assigned  
2560 to a separate, limited user account in the TOE's operating system. For all of these accounts, it is only  
2561 allowed to read, write or execute the files absolutely necessary for implementing the program logic.  
2562 For each identity interacting with the TOE, a separate operating system process is started. Especially,  
2563 the databases used by the TOE and the logging service are adequately separated for enforcement of  
2564 the necessary security domain separation (**FDP\_ACF.1**). The allowed actions and access permissions  
2565 and associated objects are assigned to the successfully approved identity of the user based on the  
2566 used authentication credentials and the resulting associated role. The current session is  
2567 unambiguously associated with this user. No interaction (e.g. access to Meter Data) is possible  
2568 without an appropriate permission catalogue (**FDP\_ACC.2**). The freeing of the role assignment and  
2569 associated resources are ensured through the monitoring of the current session.

## 2570 **7.2 SF.2: Acceptance and Deposition of Meter Data, Encryption of Meter** 2571 **Data for WAN transmission**

2572 The TOE receives Meter Data from an LMN communication channel and deposits these Meter Data  
2573 with the associated data for tariffing in a database especially assigned to this individual Meter  
2574 residing in an encrypted file system (**FCS\_COP.1/MEM**). The time interval for receiving or retrieving  
2575 Meter Data can be configured individually per meter through a successfully authenticated Gateway  
2576 Administrator and are initialized by the TOE during the setup procedure with pre-defined values.

2577 The Meter Data are cryptographically protected and their integrity is verified by the TOE before the  
2578 tariffing and deposition is performed. In case of a TLS secured communication, the integrity and  
2579 confidentiality of the transmitted data is protected by the TLS protocol according to [RFC 5246]. In  
2580 case of a unidirectional communication at IF\_GW\_MTR/wireless, the integrity is verified by the

---

---

2581 verification of the CMAC check sum whereas the protection of the confidentiality is given by the use  
2582 of AES in CBC mode with 128 bit key length in combination with the CMAC authentication  
2583 (**FCS\_CKM.1/MTR, FCS\_COP.1/MTR**). The AES encryption key has been brought into the TOE via a  
2584 management function during the pairing process for the Meter. In the TOE's internal data model, the  
2585 used cryptographic keys  $K_{mac}$  and  $K_{enc}$  are associated with the meter-id due to the fact of the  
2586 unidirectional communication. The TOE contains a packet monitor for Meter Data to avoid replay  
2587 attacks based on the re-sending of Meter Data packages. In case of recognized data packets which  
2588 have already been received and processed by the TOE, these data packets are blocked by the packet  
2589 monitor (**FPT\_RPL.1**).

2590 Concerning the service layers, the TOE detects replay attacks that can occur during authentication  
2591 processes against the TOE or for example receiving data from one of the involved communication  
2592 networks. This is for instance achieved through the correct interpretation of the strictly increasing  
2593 ordering numbers for messages from the meters (in case that a TLS-secured communication channel  
2594 is not used), through the enforcement of an appropriate time slot of execution for successfully  
2595 authenticated wake-up calls, and of course through the use of the internal means of the TLS protocol  
2596 according to [RFC 5246] (**FPT\_RPL.1**).

2597 The deposition of Meter Data is performed in a way that these Meter Data are associated with a  
2598 permission profile. This means that all of the operations and actions that can be taken with these  
2599 data as described afterwards (e.g. sending via WAN to an Authenticated External Entity) depend on  
2600 the permissions which are associated with the Meter Data. For metrological purposes, the  
2601 Meter Data's security attribute - if applicable - will be persisted associated with its corresponding  
2602 Meter Data by the TOE. All user associated data stored by the TOE are protected by an AES-128-  
2603 CMAC value. Before accessing these data, the TOE verifies the CMAC value that has been applied to  
2604 the user data and detects integrity errors on any data and especially on user associated Meter Data  
2605 in a reliable manner (**FDP\_SDI.2**).

2606 Closely linked with the deposition of the Meter Data is the assignment of an unambiguous and  
2607 reliable timestamp on these data. The reliability grounds on the regular use of an external time  
2608 source offering a sufficient exactness (**FPT\_STM.1**) which is used to synchronize the operating system

---

2609 of the TOE. A maximum deviation of 3% of the measuring period is allowed to be in conformance  
2610 with [PP\_GW]. The data set (Meter Data and tariff data) is associated with the timestamp in an  
2611 inseparably manner because each Meter Data entry in the database includes the corresponding time  
2612 stamp and the database is cryptographically protected through the encrypted file system. For details  
2613 about database encryption please see page 137).

2614 For transmission of consumption data (tariffed Meter Data) or status data into the WAN, the TOE  
2615 ensures that the data are encrypted and digitally signed (**FCO\_NRO.2**, **FCS\_CKM.1/CMS**,  
2616 **FCS\_COP.1/CMS**, **FCS\_COP.1/HASH**, **FCS\_COP.1/MEM**). In case of a successful transmission of  
2617 consumption data into the WAN, beside the transmitted data the data's signature applied by the TOE  
2618 is logged in the Consumer-Log for the respective Consumer at IF\_GW\_CON thus providing the  
2619 possibility not only for the recipient to verify the evidence of origin for the transmitted data but to  
2620 the Consumer at IF\_GW\_CON, too (**FCO\_NRO.2**). The encryption is performed with the hybrid  
2621 encryption as specified in [TR-03109-1-I] in combination with [TR-03116-3]. The public key of the  
2622 external entity, the data have to be encrypted for, is known by the TOE through the authentication  
2623 data configured by the Gateway Administrator and its assigned identity. This public key is assumed  
2624 by the TOE to be valid because the TOE does not verify the revocation status of certificates. The  
2625 public key used for the encryption of the derived symmetric key used for transmission of  
2626 consumption data is different from the public key in the TLS certificate of the external entity used for  
2627 the TLS secured communication channel. The derivation of the hybrid key used for transmission of  
2628 consumption data is done according to [TR-03116-3, chapter 8].

2629 The TOE does also foresee the case that the data is encrypted for an external entity that is not  
2630 directly assigned to the external entity holding the active communication channel. The electronic  
2631 signature is created through the utilization of the Security Module whereas the TOE is responsible for  
2632 the computation of the hash value for the data to be signed. Therefore, the TOE utilizes the SHA-256  
2633 or SHA-384 hash algorithm. The SHA-512 hash algorithm is available in the TOE but not yet used  
2634 (**FCS\_COP.1/HASH**). The data to be sent to the external entity are prepared on basis of the tariffed  
2635 meter data. The data to be transmitted are removed through deallocation of the resources after the  
2636 (successful or unsuccessful) transmission attempt so that afterwards no previous information will be  
2637 available (**FDP\_RIP.2**). The created temporary session keys which have been used for encryption of

---

2638 the data are also deleted by the already described zeroisation mechanism as soon they are not  
2639 longer needed (**FCS\_CKM.4**).

2640 The time interval for transmission of the data is set for a daily transmission, and can be additionally  
2641 configured by the Gateway Administrator. The TOE sends randomly generated messages into the  
2642 WAN, so that through this the analysis of frequency, load, size or the absence of external  
2643 communication is concealed (**FPR\_CON.1**). Data that are not relevant for accounting are aliased for  
2644 transmission so that no personally identifiable information (PII) can be obtained by an analysis of not  
2645 billing-relevant information sent to parties in the WAN. Therefore, the TOE utilizes the alias as  
2646 defined by the Gateway Administrator in the Processing Profile for the Meter identity to external  
2647 parties in the WAN. Thereby, the TOE determines the alias for a user and verifies that it conforms to  
2648 the alias given in the Processing Profile (**FPR\_PSE.1**).

### 2649 **7.3 SF.3: Administration, Configuration and SW Update**

2650 The TOE includes functionality that allows its administration and configuration as well as updating  
2651 the TOE's complete firmware ("firmware updates") or only the software application including the  
2652 service layer ("software updates"). This functionality is only provided for the authenticated Gateway  
2653 Administrator (**FMT\_MOF.1, FMT\_MSA.1/AC, FMT\_MSA.1/FW, FMT\_MSA.1/MTR**).

2654 The following operations can be performed by the successfully authenticated Gateway  
2655 Administrator:

- 2656 a) Definition and deployment of Processing Profiles including user administration, rights  
2657 management and setting configuration parameters of the TOE
- 2658 b) Deployment of tariff information
- 2659 c) Deployment and installation of software/firmware updates

2660 A complete overview of the possible management functions is given in Table 14 and Table 15  
2661 (**FMT\_SMF.1**). Beside the possibility for a successfully authenticated Service Technician to view the  
2662 system log via interface IF\_GW\_SRV, administrative or configuration measures on the TOE can only  
2663 be taken by the successfully authenticated Gateway Administrator.

---

---

2664 In order to perform these measures, the TOE has to establish a TLS secured channel to the Gateway  
2665 Administrator and must authenticate the Gateway Administrator successfully. There are two  
2666 possibilities:

- 2667 a) The TOE independently contacts the Gateway Administrator at a certain time specified in  
2668 advance by the Gateway Administrator.
- 2669 b) Through a message sent to the wake-up service, the TOE is requested to contact the  
2670 Gateway Administrator.

2671 In the second case, the wake-up data packet is received by the TOE from the WAN and checked by  
2672 the TOE for structural correctness according to [TR-03109-1]. Afterwards, the TOE verifies the  
2673 correctness of the electronic signature applied to the wake-up message data packet using the  
2674 certificate of the Gateway Administrator stored in the TSF data. Afterwards, a TLS connection to the  
2675 Gateway Administrator is established by the TOE and the above mentioned operations can be  
2676 performed.

2677 Software/firmware updates always have to be signed by the TOE manufacturer.

2678 Software/firmware updates can be of different content:

- 2679 a) The whole boot image of the TOE is changed.
- 2680 b) Only individual components of the TOE are changed. These components can be the boot  
2681 loader plus the static kernel or the SMGW application.

2682 The update packet is realized in form of an archive file enveloped into a CMS signature container  
2683 according to [RFC 5652]. The electronic signature of the update packet is created using signature  
2684 keys from the TOE manufacturer. The verification of this signature is performed by the TOE using the  
2685 TOE's Security Module using the trust anchor of the TOE manufacturer. If the signature of the  
2686 transferred data could not be successfully verified by the TOE or if the version number of the new  
2687 firmware is not higher than the version number of the installed firmware, the received data is  
2688 rejected by the TOE and not used for further processing. Any administrator action is entered in the  
2689 System Log of the TOE. Additionally, an authorised Consumer can interact with the TOE via the  
2690 interface IF\_GW\_CON to get the version number and the current time displayed (**FMT\_MOF.1**).

---

2691 The signature of the update packet is immediately verified after receipt. After successful verification  
2692 of the update packet the update process is immediately performed. In each case, the Gateway  
2693 Administrator gets notified by the TOE and an entry in the TOE's system log will be written.

2694 All parameters that can be changed by the Gateway Administrator are preset with restrictive values  
2695 by the TOE. No role can specify alternative initial values to override these restrictive default values  
2696 (**FMT\_MSA.3/AC, FMT\_MSA.3/FW, FMT\_MSA.3/MTR**).

2697 This mechanism is supported by the TOE-internal resource monitor that internally monitors existing  
2698 connections, assigned roles and operations allowed at a specific time.

#### 2699 **7.4 SF.4: Displaying Consumption Data**

2700 The TOE offers the possibility of displaying consumption data to authenticated Consumers at  
2701 interface IF\_GW\_CON. Therefore, the TOE contains a web server that implements TLS-based  
2702 communication with mutual authentication (**FTP\_ITC.1/USR**). If the Consumer requests a password-  
2703 based authentication from the GWA according to [TR-03109-1] and the GWA activates this  
2704 authentication method for this Consumer, the TOE uses TLS authentication with server-side  
2705 authentication and HTTP digest access authentication according to [RFC 7616]. In both cases, the  
2706 requirement **FCO\_NRO.2** is fulfilled through the use of TLS-based communication and through  
2707 encryption and digital signature of the (tariffed) Meter Data to be displayed using **FCS\_COP.1/HASH**.

2708 To additionally display consumption data, a connection at interface IF\_GW\_CON must be established  
2709 and the role "(authorised) Consumer" is assigned to the user with his used display unit by the TOE.  
2710 Different Consumer can use different display units. The amount of allowed connection attempts at  
2711 IF\_GW\_CON is set to 5. In case the amount of allowed connection attempts is reached, the TOE  
2712 blocks IF\_GW\_CON (**FIA\_AFL.1**). The display unit has to technically support the applied  
2713 authentication mechanism and the HTTP protocol version 1.1 according to [RFC 2616] as  
2714 communication protocol. Data is provided as HTML data stream and transferred to the display unit.  
2715 In this case, further processing of the transmitted data stream is carried out by the display unit.

---

---

2716 According to [TR-03109-1], the TOE exclusively transfers Consumer specific consumption data to the  
2717 display unit. The Consumer can be identified in a clear and unambiguous manner due to the applied  
2718 authentication mechanism. Moreover, the TOE ensures that exclusively the data actually assigned to  
2719 the Consumer is provided at the display unit via IF\_GW\_CON (**FIA\_USB.1**).

## 2720 **7.5 SF.5: Audit and Logging**

2721 The TOE generates audit data for all actions assigned in the System-Log (**FAU\_GEN.1/SYS**), the  
2722 Consumer-Log (**FAU\_GEN.1/CON**), and the Calibration-Log (**FAU\_GEN.1/CAL**) as well. On the one  
2723 hand, this applies to the values measured by the Meter (Consumer-Log) and on the other hand to  
2724 system data (System-Log) used by the Gateway Administrator of the TOE in order to check the TOE's  
2725 current functional status. In addition, metrological entries are created in the Calibration-Log. The TOE  
2726 thus distinguishes between the following log classes:

- 2727 a) System-Log
- 2728 b) Consumer-Log
- 2729 c) Calibration-Log

2730 The TOE audits and logs all security functions that are used. Thereby, the TOE component  
2731 accomplishing this security audit functionality includes the necessary rules monitoring these audited  
2732 events and through this indicating a potential violation of the enforcement of the TOE security  
2733 functionality (e. g. in case of an integrity violation, replay attack or an authentication failure). If such  
2734 a security breach is detected, it is shown as such in the log entry (**FAU\_SAA.1/SYS**).

2735 The System-Log can only be read by the authorized Gateway Administrator via interface  
2736 IF\_GW\_WAN or by an authorized Service Technician via interface IF\_GW\_SRV (**FAU\_SAR.1/SYS**).  
2737 Potential security breaches are separately indicated and identified as such in the System-Log and the  
2738 GWA gets informed about this potential security breach (**FAU\_ARP.1/SYS**, **FDP\_SDI.2**). Data of the  
2739 Consumer-Log can exclusively be viewed by authenticated Consumers via interface IF\_GW\_CON  
2740 designed to display consumption data (**FAU\_SAR.1/CON**). The data included in the Calibration-Log

---

---

2741 can only be read by the authenticated Gateway Administrator via interface IF\_GW\_WAN  
2742 (**FAU\_SAR.1/CAL**).

2743 If possible, each log entry is assigned to an identity that is known to the TOE. For audit events  
2744 resulting from actions of identified users resp. roles, the TOE associates the generated log  
2745 information to the identified users while generating the audit information (**FAU\_GEN.2**).

2746 Generated audit and log data are stored in a cryptographically secured storage. For this purpose, a  
2747 file-based SQL database system is used securing its' data using an AES-XTS-128 encrypted file system  
2748 (AES in XTS mode with 128-bit keys) according to [FIPS Pub. 197] and [NIST 800-38E]. This is achieved  
2749 by using device-specific AES keys so that the secure environment can only be accessed with the  
2750 associated symmetric key available. Using an appropriately limited access of this symmetric, the TOE  
2751 implements the necessary rules so that it can be ensured that unauthorised modification or deletion  
2752 is prohibited (**FAU\_STG.2**).

2753 Audit and log data are stored in separate locations: One location is used to store Consumer-specific  
2754 log data (Consumer-Log) whereas device status data and metrological data are stored in a separate  
2755 location: status data are stored in the System-Log and metrological data are stored in the Calibration-  
2756 Log. Each of these logs is located in physically separate databases secured by different cryptographic  
2757 keys. In case of several external meters, a separate database is created for each Meter to store the  
2758 respective consumption and log data (**FAU\_GEN.2**).

2759 If the audit trail of the System-Log or the Consumer-Log is full (so that no further data can be added),  
2760 the oldest entries in the audit trail are overwritten (**FAU\_STG.2, FAU\_STG.4/SYS, FAU\_STG.4/CON**).

2761 If the Consumer-Log's oldest audit record must be kept because the period of billing verification (of  
2762 usually 15 months) has not been reached, the TOE's metrological activity is paused until the oldest  
2763 audit record gets deletable. Thereafter, the TOE's metrological activity is started again through an  
2764 internal timer. Moreover, the mechanism for storing log entries is designed in a way that these  
2765 entries are cryptographically protected against unauthorized deletion. This is especially achieved by  
2766 assigning cryptographic keys to each of the individual databases for the System-Log, Consumer-Log  
2767 and Calibration-Log.

---

---

2768 If the Calibration-Log cannot store any further data, the operation of the TOE is stopped through the  
2769 termination of its metering services and the TOE informs the Gateway Administrator by creating an  
2770 entry in the System-Log, so that additional measures can be taken by the Gateway Administrator.  
2771 Calibration-Log entries are never overwritten by the TOE (**FAU\_STG.2, FAU\_STG.4/CAL,**  
2772 **FMT\_MOF.1**).

2773 The TOE anonymizes the data in a way that no conclusions about a specific person or user can be  
2774 drawn from the log or recorded not billing relevant data. Stored consumption data are exclusively  
2775 intended for accounting with the energy supplier. The data stored in the System-Log are used for  
2776 analysis purposes concerning necessary technical analyses and possible security-related information.

## 2777 **7.6 SF.6: TOE Integrity Protection**

2778 The TOE makes physical tampering detectable through the TOE's sealed packaging of the device. So if  
2779 an attacker opens the case, this can be physically noticed, e. g. by the Service Technician  
2780 (**FPT\_PHP.1**).

2781 The TOE provides a secure boot mechanism. Beginning from the AES-128-encrypted bootloader  
2782 protected by a digital signature applied by the TOE manufacturer, each subsequent step during the  
2783 boot process is based on the previous step establishing a continuous forward-concatenation of  
2784 cryptographical verification procedures. Thus, it is ensured that each part of the firmware, that  
2785 means the operating system, the service layers and the software application in general, is tested by  
2786 the TOE during initial startup. Thereby, a test of the TSF data being part of the software application is  
2787 included. During this complete self-test, it is checked that the electronic system of the physical  
2788 device, and all firmware components of the TOE are in authentic condition. This complete self-test  
2789 can also be run at the request of the successfully authenticated Gateway Administrator via interface  
2790 IF\_GW\_WAN or at the request of the successfully authenticated Service Technician via interface  
2791 IF\_GW\_SRV. At the request of the successfully authenticated Consumer via interface IF\_GW\_CON,  
2792 the TOE will only test the integrity of the Smart Metering software application including the service  
2793 layers (without the operating system) and the completeness of the TSF data stored in the TOE's

---

2794 database. Additionally, the TOE itself runs a complete self-test periodically at least once a month  
 2795 during normal operation. The integrity of TSF data stored in the TOE’s database is always tested  
 2796 during read access of that part of TSF data (**FPT\_TST.1**). **FPT\_RPL.1** is fulfilled by the use of the TLS  
 2797 protocol respectively the integration of transmission counters according to [TR-03116-3, chap. 7.3],  
 2798 and through the enforcement of an appropriate time slot of execution for successfully authenticated  
 2799 wake-up calls.

2800 If an integrity violation of the TOE’s hardware or firmware is detected or if the deviation between  
 2801 local system time of the TOE and the reliable external time source is too large, further use of the TOE  
 2802 for the purpose of gathering Meter Data is not possible. Also in this case, the TOE signals the  
 2803 incorrect status via a suitable signal output on the case of the device, and the further use of the TOE  
 2804 for the purpose of gathering Meter Data is not allowed (**FPT\_FLS.1**).

2805 Basically, if an integrity violation is detected, the TOE will create an entry in the System Log to  
 2806 document this status for the authorised Gateway Administrator on interface IF\_GW\_WAN resp. for  
 2807 the authorised Service Technician on interface IF\_GW\_SRV, and will inform the Gateway  
 2808 Administrator on this incident (**FAU\_ARP.1/SYS, FAU\_GEN.1/SYS, FAU\_SAR.1/SYS, FPT\_TST.1**).

2809 **7.7 TSS Rationale**

2810 The following table shows the correspondence analysis for the described TOE security functionalities  
 2811 and the security functional requirements.

	SF.1	SF.2	SF.3	SF.4	SF.5	SF.6
FAU_ARP.1/SYS					X	(X)
FAU_GEN.1/SYS					X	(X)

2841 **10 Appendix**2842 **10.1 Mapping from English to German terms**

English term	German term
billing-relevant	abrechnungsrelevant
CLS, Controllable Local System	dezentral steuerbare Verbraucher- oder Erzeugersysteme
Consumer	Anschlussnutzer; Letztverbraucher (im verbrauchenden Sinne); u.U. auch Einspeiser
Consumption Data	Verbrauchsdaten
Gateway	Kommunikationseinheit
Grid	Netz (für Strom/Gas/Wasser)
Grid Status Data	Zustandsdaten des Versorgungsnetzes
LAN, Local Area Network	Lokales Kommunikationsnetz
LMN, Local Metrological Network	Lokales Messeinrichtungsnetz
Meter	Messeinrichtung (Teil eines Messsystems)
Processing Profiles	Konfigurationsprofile
Security Module	Sicherheitsmodul (z.B. eine Smart Card)
Service Provider	Diensteanbieter
Smart Meter, Smart Metering System <sup>227</sup>	Intelligente, in ein Kommunikationsnetz eingebundene, elektronische Messeinrichtung (Messsystem)
TOE	EVG ( <b>E</b> valuierungs <b>g</b> egenstand)
WAN, Wide Area Network	Weitverkehrsnetz (für Kommunikation)

2843

---

<sup>227</sup> Please note that the terms "Smart Meter" and "Smart Metering System" are used synonymously within this document.

2844 **10.2 Glossary**

Term	Description
Authenticity	property that an entity is what it claims to be (according to [SD_6])
Block Tariff	Tariff in which the charge is based on a series of different energy/volume rates applied to successive usage blocks of given size and supplied during a specified period. (according to [CEN])
BPL	<i>Broadband Over Power Lines</i> , a method of power line communication
CA	Certification Authority, an entity that issues digital certificates. CLS config
CDMA	<i>Code Division Multiple Access</i>
CLS config (secondary asset)	See chapter 3.2
CMS	Cryptographic Message Syntax
Confidentiality	the property that information is not made available or disclosed to unauthorised individuals, entities, or processes (according to [SD_6])
Consumer	End user of electricity, gas, water or heat (according to [CEN]). See chapter 3.1
DCP	<i>Data Co-Processor</i> ; security hardware of the CPU
DLMS	Device Language Message Specification
DTBS	Data To Be Signed
EAL	Evaluation Assurance Level
Energy Service Provider	Organisation offering energy related services to the Consumer (according to [CEN])
ETH	Ethernet
external entity	See chapter 3.1
firmware update	See chapter 3.2
Gateway Administrator (GWA)	See chapter 3.1
Gateway config (secondary asset)	See chapter 3.2
Gateway time	See chapter 3.2
GPRS	<i>General Packet Radio Service</i> , a packet oriented mobile data service
Home Area Network (HAN)	In-house data communication network which interconnects domestic equipment and can be used for energy management purposes (adopted according to [CEN]).
Integrity	property that sensitive data has not been modified or deleted in an unauthorised and undetected manner (according to [SD_6])
IT-System	Computersystem

Term	Description
Local Area Network (LAN)	Data communication network, connecting a limited number of communication devices (Meters and other devices) and covering a moderately sized geographical area within the premises of the consumer. In the context of this ST, the term LAN is used as a hypernym for HAN and LMN (according to [CEN], adopted).
Local attacker	See chapter 3.4
LTE	<i>Long Term Evolution</i> mobile broadband communication standard
Meter config (secondary asset)	See chapter 3.2
Local Metrological Network (LMN)	In-house data communication network which interconnects metrological equipment.
Meter Data	See chapter 3.2
Meter Data Aggregator (MDA)	Entity which offers services to aggregate metering data by grid supply point on a contractual basis. NOTE: The contract is with a supplier. The aggregate is of all that supplier's consumers connected to that particular grid supply point. The aggregate may include both metered data and data estimated by reference to standard load profiles (adopted from [CEN])
Meter Data Collector (MDC)	Entity which offers services on a contractual basis to collect metering data related to a supply and provide it in an agreed format to a data aggregator (that can also be the DNO). NOTE: The contract is with a supplier or a pool. The collection may be carried out by manual or automatic means. ([CEN])
Meter Data Management System (MDMS)	System for validating, storing, processing and analysing large quantities of Meter Data. ([CEN])
Metrological Area Network	In-house data communication network which interconnects metrological equipment (i.e. Meters)
OEM	Original Equipment Manufacturer
OMS	Open Metering System
OCOTP	On-Chip One-time-programmable
Personally Identifiable Information (PII)	Personally Identifiable Information refers to information that can be used to uniquely identify, contact, or locate a single person or can be used with other sources to uniquely identify a single individual.
RJ45	registered jack #45; a standardized physical network interface
RMII	Reduced Media Independent Interface
RTC	Real Time Clock
Service Technician	Human entity being responsible for diagnostic purposes.

Term	Description
Smart Metering System	The Smart Metering System consists of a Smart Meter Gateway and connected to one or more meters. In addition, CLS (i.e. generation plants) may be connected with the gateway for dedicated communication purposes.
SML	Smart Message Language
Tariff	Price structure (normally comprising a set of one or more rates of charge) applied to the consumption or production of a product or service provided to a Consumer (according to [CEN]).
TCP/IP	Transmission Control Protocol / Internet Protocol
TLS	Transport Layer Security protocol according to [RFC 5246]
TOE	Target of Evaluation - set of software, firmware and/or hardware possibly accompanied by guidance
TSF	TOE security functionality
UART	Universal Asynchronous Receiver Transmitter
WAN attacker	See chapter 3.4
WLAN	Wireless Local Area Network

2972	[RFC 5639]	RFC 5639, Elliptic Curve Cryptography (ECC) Brainpool Standard Curves and
2973		Curve Generation, M. Lochter, BSI, J. Merkle, secunet Security Networks,
2974		March 2010, <a href="http://www.ietf.org/rfc/rfc5639.txt">http://www.ietf.org/rfc/rfc5639.txt</a>
2975	[RFC 5652]	RFC 5652, Cryptographic Message Syntax (CMS), R. Housley, Vigil Security,
2976		September 2009, <a href="http://www.ietf.org/rfc/rfc5652.txt">http://www.ietf.org/rfc/rfc5652.txt</a>
2977	[EIA RS-485]	EIA Standard RS-485, Electrical Characteristics of Generators and Receivers
2978		for Use in Balanced Multipoint Systems, ANSI/TIA/EIA-485-A-98, 1983/R2003
2979	[EN 13757-1]	M-Bus DIN EN 13757-1: Kommunikationssysteme für Zähler und deren
2980		Fernablesung Teil 1: Datenaustausch
2981	[EN 13757-3]	M-Bus DIN EN 13757-3, Kommunikationssysteme für Zähler und deren
2982		Fernablesung Teil 3: Spezielle Anwendungsschicht
2983	[EN 13757-4]	M-Bus DIN EN 13757-4, Kommunikationssysteme für Zähler und deren
2984		Fernablesung Teil 4: Zählerauslesung über Funk, Fernablesung von Zählern im
2985		SRD-Band von 868 MHz bis 870 MHz
2986	[IEC-62056-5-3-8]	Electricity metering – Data exchange for meter reading, tariff and load
2987		control – Part 5-3-8: Smart Message Language SML, 2012
2988	[IEC-62056-6-1]	IEC-62056-6-1, Datenkommunikation der elektrischen Energiemessung, Teil
2989		6-1: OBIS Object Identification System, 2017, International Electrotechnical
2990		Commission
2991	[IEC-62056-6-2]	IEC-62056-6-2, Datenkommunikation der elektrischen Energiemessung -
2992		DLMS/COSEM, Teil 6-2: COSEM Interface classes, 2017, International
2993		Electrotechnical Commission
2994	[IEC-62056-21]	IEC-62056-21, Direct local data exchange - Mode C, 2011, International
2995		Electrotechnical Commission
2996	[LUKS]	LUKS On-Disk Format Specification Version 1.2.1, Clemens Fruhwirth,
2997		October 16th, 2011
