Version 5.2

from secunet Security Networks AG  
PP Conformance: None  
Functionality: Product specific Security Target  
Common Criteria Part 2 conformant  
Assurance: Common Criteria Part 3 conformant  
EAL 4 augmented by ASE\_TSS.2, ALC\_FLR.2 and  
AVA\_VAN.5  
valid until: 25 Month 2029

SOGIS  
Recognition Agreement  
for components up to  
EAL 4

The IT Product identified in this certificate has been evaluated at an approved evaluation facility using the Common Methodology for IT Security Evaluation (CEM), Version 3.1 extended by Scheme Interpretations for conformance to the Common Criteria for IT Security Evaluation (CC), Version 3.1. CC and CEM are also published as ISO/IEC 15408 and ISO/IEC 18045.

(\*) This certificate applies only to the specific version and release of the product in its evaluated configuration and in conjunction with the complete Certification Report and Notification. For details on the validity see Certification Report part A chapter 5.

The evaluation has been conducted in accordance with the provisions of the certification scheme of the German Federal Office for Information Security (BSI) and the conclusions of the evaluation facility in the evaluation technical report are consistent with the evidence adduced.

This certificate is not an endorsement of the IT Product by the Federal Office for Information Security or any other organisation that recognises or gives effect to this certificate, and no warranty of the IT Product by the Federal Office for Information Security or any other organisation that recognises or gives effect to this certificate, is either expressed or implied.

## A. Certification

### 1. Preliminary Remarks

Under the BSIG<sup>1</sup> Act, the Federal Office for Information Security (BSI) has the task of issuing certificates for information technology products.

Certification of a product is carried out on the instigation of the vendor or a distributor, hereinafter called the sponsor.

A part of the procedure is the technical examination (evaluation) of the product according to the security criteria published by the BSI or generally recognised security criteria.

The evaluation is normally carried out by an evaluation facility recognised by the BSI or by BSI itself.

The result of the certification procedure is the present Certification Report. This report contains among others the certificate (summarised assessment) and the detailed Certification Results.

The Certification Results contain the technical description of the security functionality of the certified product, the details of the evaluation (strength and weaknesses) and instructions for the user.

### 2. Specifications of the Certification Procedure

The certification body conducts the procedure according to the criteria laid down in the following:

- Act on the Federal Office for Information Security<sup>1</sup>
- BSI Certification and Approval Ordinance<sup>2</sup>
- BSI Schedule of Costs BMI Regulations on Ex-parte Costs<sup>3</sup>
- Special decrees issued by the Bundesministerium des Innern und für Heimat (Federal Ministry of the Interior and Community)
- DIN EN ISO/IEC 17065 standard
- BSI certification: Scheme documentation describing the certification process (CC-Produkte) [3]
- BSI certification: Scheme documentation on requirements for the Evaluation Facility, its approval and licencing process (CC-Stellen) [3]
- Common Criteria for IT Security Evaluation (CC), Version 3.1<sup>4</sup> [1] also published as ISO/IEC 15408

<sup>1</sup> Act on the Federal Office for Information Security (BSI-Gesetz - BSIG) of 14 August 2009, Bundesgesetzblatt I p. 2821

<sup>2</sup> Ordinance on the Procedure for Issuance of Security Certificates and approval by the Federal Office for Information Security (BSI-Zertifizierungs- und -Anerkennungsverordnung - BSIZertV) of 17 December 2014, Bundesgesetzblatt 2014, part I, no. 61, p. 2231

<sup>3</sup> BMI Regulations on Ex-parte Costs - Besondere Gebührenverordnung des BMI für individuell zurechenbare öffentliche Leistungen in dessen Zuständigkeitsbereich (BMIBGebV), Abschnitt 7 (BSI-Gesetz) - dated 2 September 2019, Bundesgesetzblatt I p. 1365

- Common Methodology for IT Security Evaluation (CEM), Version 3.1 [2] also published as ISO/IEC 18045
- BSI certification: Application Notes and Interpretation of the Scheme (AIS) [4]

### 3. Recognition Agreements

In order to avoid multiple certification of the same product in different countries a mutual recognition of IT security certificates - as far as such certificates are based on ITSEC or CC - under certain conditions was agreed.

#### 3.1. European Recognition of CC – Certificates (SOGIS-MRA)

The SOGIS-Mutual Recognition Agreement (SOGIS-MRA) Version 3 became effective in April 2010. It defines the recognition of certificates for IT-Products at a basic recognition level and, in addition, at higher recognition levels for IT-Products related to certain SOGIS Technical Domains only.

The basic recognition level includes Common Criteria (CC) Evaluation Assurance Levels EAL 1 to EAL 4. For "Smartcards and similar devices" a SOGIS Technical Domain is in place. For "HW Devices with Security Boxes" a SOGIS Technical Domains is in place, too. In addition, certificates issued for Protection Profiles based on Common Criteria are part of the recognition agreement.

The current list of signatory nations and approved certification schemes, details on recognition, and the history of the agreement can be seen on the website at <https://www.sogis.eu>.

The SOGIS-MRA logo printed on the certificate indicates that it is recognised under the terms of this agreement by the related bodies of the signatory nations. A disclaimer beneath the logo indicates the specific scope of recognition.

This certificate is recognized according to the rules of SOGIS-MRA, i.e. up to and including CC part 3 EAL 4 components. The evaluation contained the components ASE\_TSS.2, ALC\_FLR.2 and AVA\_VAN.5 that are not mutually recognised in accordance with the provisions of the SOGIS MRA. For mutual recognition the EAL 4 components of these assurance families are relevant.

#### 3.2. International Recognition of CC – Certificates (CCRA)

The international arrangement on the mutual recognition of certificates based on the CC (Common Criteria Recognition Arrangement, CCRA-2014) has been ratified on 08 September 2014. It covers CC certificates based on collaborative Protection Profiles (cPP) (exact use), CC certificates based on assurance components up to and including EAL 2 or the assurance family Flaw Remediation (ALC\_FLR) and CC certificates for Protection Profiles and for collaborative Protection Profiles (cPP).

The current list of signatory nations and approved certification schemes can be seen on the website: <https://www.commoncriteriaportal.org>.

The Common Criteria Recognition Arrangement logo printed on the certificate indicates that this certification is recognised under the terms of this agreement by the related bodies

<sup>4</sup> Proclamation of the Bundesministerium des Innern und für Heimat of 12 February 2007 in the Bundesanzeiger dated 23 February 2007, p. 3730

of the signatory nations. A disclaimer beneath the logo indicates the specific scope of recognition.

This certificate is recognized according to the rules of CCRA-2014, i. e. up to and including CC part 3 EAL 2 and ALC\_FLR components.

## 4. Performance of Evaluation and Certification

The certification body monitors each individual evaluation to ensure a uniform procedure, a uniform interpretation of the criteria and uniform ratings.

The product secunet SBC Container, Version 5.2 has undergone the certification procedure at BSI. This is a re-certification based on BSI-DSZ-CC-1089-V2-2022.

The evaluation of the product secunet SBC Container, Version 5.2 was conducted by SRC Security Research & Consulting GmbH. The evaluation was completed on 24 June 2024. SRC Security Research & Consulting GmbH is an evaluation facility (ITSEF)<sup>5</sup> recognised by the certification body of BSI.

For this certification procedure the sponsor and applicant is: secunet Security Networks AG.

The product was developed by: Frafos GmbH.

The certification is concluded with the comparability check and the production of this Certification Report. This work was completed by the BSI.

## 5. Validity of the Certification Result

This Certification Report applies only to the version of the product as indicated. The confirmed assurance package is valid on the condition that

- all stipulations regarding generation, configuration and operation, as given in the following report, are observed,
- the product is operated in the environment described, as specified in the following report and in the Security Target.

For the meaning of the assurance components and assurance levels please refer to CC itself. Detailed references are listed in part C of this report.

The Certificate issued confirms the assurance of the product claimed in the Security Target at the date of certification. As attack methods evolve over time, the resistance of the certified version of the product against new attack methods needs to be re-assessed. Therefore, the sponsor should apply for the certified product being monitored within the assurance continuity program of the BSI Certification Scheme (e.g. by a re-assessment or re-certification). Specifically, if results of the certification are used in subsequent evaluation and certification procedures, in a system integration process or if a user's risk management needs regularly updated results, it is recommended to perform a re-assessment on a regular e.g. annual basis.

In order to avoid an indefinite usage of the certificate when evolved attack methods would require a re-assessment of the products resistance to state of the art attack methods, the maximum validity of the certificate has been limited. The certificate issued on 26 June 2024 is valid until 25 June 2029. Validity can be re-newed by re-certification.

<sup>5</sup> Information Technology Security Evaluation Facility

The owner of the certificate is obliged:

1. when advertising the certificate or the fact of the product's certification, to refer to the Certification Report as well as to provide the Certification Report, the Security Target and user guidance documentation mentioned herein to any customer of the product for the application and usage of the certified product,
2. to inform the Certification Body at BSI immediately about vulnerabilities of the product that have been identified by the developer or any third party after issuance of the certificate,
3. to inform the Certification Body at BSI immediately in the case that security relevant changes in the evaluated life cycle, e.g. related to development and production sites or processes, occur, or the confidentiality of documentation and information related to the Target of Evaluation (TOE) or resulting from the evaluation and certification procedure where the certification of the product has assumed this confidentiality being maintained, is not given any longer. In particular, prior to the dissemination of confidential documentation and information related to the TOE or resulting from the evaluation and certification procedure that do not belong to the deliverables according to the Certification Report part B, or for those where no dissemination rules have been agreed on, to third parties, the Certification Body at BSI has to be informed.

In case of changes to the certified version of the product, the validity can be extended to the new versions and releases, provided the sponsor applies for assurance continuity (i.e. re-certification or maintenance) of the modified product, in accordance with the procedural requirements, and the evaluation does not reveal any security deficiencies.

## 6. Publication

The product secunet SBC Container, Version 5.2 has been included in the BSI list of certified products, which is published regularly (see also Internet: <https://www.bsi.bund.de> and [5]). Further information can be obtained from BSI-Infoline +49 228 9582-111.

Further copies of this Certification Report can be requested from the developer<sup>6</sup> of the product. The Certification Report may also be obtained in electronic form at the internet address stated above.

45138 Essen  
Deutschland

## **B. Certification Results**

The following results represent a summary of

- the Security Target of the sponsor for the Target of Evaluation,
- the relevant evaluation results from the evaluation facility, and
- complementary notes and stipulations of the certification body.

## 1. Executive Summary

Target of evaluation (TOE) is the product secunet SBC Container, Version 5.2 provided by Frafos GmbH.

TOE Type: Session Border Controller

The secunet SBC Container is a Session Border Controller Container, a Linux systemd-nspawn container which can be deployed on a Linux operating system. The main purpose of the secunet SBC Container is a secure bridging between an SIP caller and the SIP callee. Concretely, the SBC supports a safeguarded initiation of SIP sessions (also called signalling) and bridging of media communication streams such as RTP or SRTP. A Session Border Controller (SBC) is a device which is deployed in Voice-over-IP (VoIP) networks to manage the signalling and media streams of audio and video communication. The used hardware is under full control of the operating system. However, the connected networks have to be separated physically, especially the management network, to allow the secunet SBC container to perform the intended operation in a secure manner.

The TOE is integrated in a Linux operating system platform, where the Back-to-Back User Agent module (abbreviated B2BUA with the functionality being referred to as Packet Filtering) is placed.

The secunet SBC Container is a software TOE which must be deployed on a hardened Linux operating system platform, i.e. a certified secunet Wall at least version 6.1.0 or a hardened Debian at least version 11. These operating system platforms protect the integrity of the TOE.

The Security Target [6] is the basis for this certification. It is not based on a certified Protection Profile.

The TOE Security Assurance Requirements (SAR) are based entirely on the assurance components defined in Part 3 of the Common Criteria (see part C or [1], Part 3 for details). The TOE meets the assurance requirements of the Evaluation Assurance Level EAL 4 augmented by ASE\_TSS.2, ALC\_FLR.2 and AVA\_VAN.5.

The TOE Security Functional Requirements (SFR) relevant for the TOE are outlined in the Security Target [6], chapter 6.1. They are all selected from Common Criteria Part 2. Thus the TOE is CC Part 2 conformant.

The TOE Security Functional Requirements are implemented by the following TOE Security Functionality:

TOE Security Functionality	Addressed issue
SF.PacketFiltering, Packet Filtering	The TOE performs an inspection and filtering on several levels: SIP method filtering: the TOE performs filtering based on the SIP method, e.g.: "INVITE", "SUBSCRIBE", "REGISTER", to allow e.g. only to register devices from the inside network. The TOE can also set a limit of invite messages per time interval from outside to protect the components in the inner network from Denial-of-Service (DoS) attacks. Another filtering method is the manipulation of the SIP header field. This serves two purposes: The packet headers from the inside network to the outside network is stripped from information which potentially could allow the attacker to determine the components used in the inside network, e.g. the user-agent field. Also, the header fields of packets from the external network to the internal

TOE Security Functionality	Addressed issue
	<p>network are stripped in order to prevent exploitation of the internal components with e.g. malformed SIP or media packets.</p> <p>At the body of the message the content type is filtered to e.g. "application-sdp", to allow only the correct content. Also, the media type can be set to e.g. audio, video or application. Finally, the codec can be filtered to allow only specific codecs, e.g. G.711 or Opus.</p> <p>To hide the topology of the internal network the TOE implements a strict Back-to-Back user agent to establish two completely separated calls originating from the SBC. Thus, at the external network no internal dialogue IDs (Call-ID header field, 'tag' attribute in From and To header fields) and IP addresses are visible. The filtering of dialogue IDs is always active "by design", the filtering is always active. The filtering of internal IP addresses can be configured by the TOE administrator.</p> <p>Media streams such as (S)RTP shall only be allowed if a session was initiated before using SIP. Malformed SIP and media stream packets shall always be refused or dropped.</p>
<p>SF.Management, Management of Security Functions</p>	<p>The initial deployment as well as updates of the TOE are performed by changing the whole container using appropriate tools. This is out of the TOE scope and part of the TOE environment.</p> <p>The TOE can be configured by using the JSON configuration files which is deployed directly on the SBC by using the SSH interface.</p> <p>The TOE only maintains the role TOE Administrator. This role however is assigned to every user who is in the Linux group "root" which allows the user to update TOE configuration. The TOE allows the user with the role TOE Administrator to define complex filtering and protocol management rules. This includes:</p> <ul style="list-style-type: none"> <li>● create, modify, and delete the signalling (SIP) and media stream endpoints on the SBC,</li> <li>● create, modify, and delete the routing of SIP calls, SIP registrations and other SIP messages between the realms and elements in the network,</li> <li>● create, modify, and delete the rules for filtering and manipulation options of SIP calls, SIP registrations and other SIP messages,</li> <li>● create, modify, and delete the rules for filtering and manipulation options of media stream packets and</li> <li>● manage all SIP Information Flow SFP security attributes.</li> </ul>
<p>SF.Authentication, Authentication of Administrators</p>	<p>Users can log in at the management interface with username and password. The Authentication is performed either locally or by using an external LDAP server, depending on the TOE configuration. If Authentication is performed locally the password needs a minimum size of 8 characters. After three wrong authentication attempts the user account is disabled for a configurable time period to prevent brute force attacks against the management interface.</p> <p>When external authentication is used the authentication of the user is performed by the LDAP server. Then after a successful authentication at the LDAP server the TOE as-signs the access</p>

TOE Security Functionality	Addressed issue
	conditions of this user based on the roles assigned to the user in on the LDAP server.
SF.Logging, Security Logging	The TOE provides several interfaces for logging and analyzing of the VoIP network. A syslog daemon is running on the TOE which writes log files to a configured remote syslog server located in the management network. Additionally, the TOE sends event messages to a database in the management network, which can then be reviewed by the ABC Monitor.

Table 1: TOE Security Functionalities

For more details please refer to the Security Target [6], chapter 6.1.

The assets to be protected by the TOE are defined in the Security Target [6], chapter 3.1. Based on these assets the TOE Security Problem is defined in terms of Assumptions, Threats and Organisational Security Policies. This is outlined in the Security Target [6], chapter 3.

This certification covers the configurations of the TOE as outlined in chapter 8.

The vulnerability assessment results as stated within this certificate do not include a rating for those cryptographic algorithms and their implementation suitable for encryption and decryption (see BSIG Section 9, Para. 4, Clause 2).

The certification results only apply to the version of the product indicated in the certificate and on the condition that all the stipulations are kept as detailed in this Certification Report. This certificate is not an endorsement of the IT product by the Federal Office for Information Security (BSI) or any other organisation that recognises or gives effect to this certificate, and no warranty of the IT product by BSI or any other organisation that recognises or gives effect to this certificate, is either expressed or implied.

## 2. Identification of the TOE

The Target of Evaluation (TOE) is called:

**secunet SBC Container, Version 5.2**

The following table outlines the TOE deliverables:

No	Type	Identifier	Release	SHA-256 hash sum
1	SW	secunet SBC container version 4.2.10-16	Labeling “secunet-sbc-container-container-5-2-11-2.tgz“	6223f47f516afb5cdf42e0c174ef221b4d7c6848ef33aa113532efc600a23224
	detached signature file	secunet SBC container signature	Labeling “secunet-sbc-container-5-2-11-2.tgz.sig“	-
2	DOC	Secunet SBC Container Handbook 4.2 documentation	SBC – AGD v3.6.pdf Version 3.6	9bbf7adb520ceee25abd546970eaca24ad391f8ebb05b3d5df103a3a3b22941f
	detached signature file	secunet SBC container signature	Labeling “SBC – AGD v3.6.pdf.sig“	-

Table 2: Deliverables of the TOE

The TOE is delivered via secure communication channel (SFTP server) as described in [7], section 2.

The files for secunet SBC Container and Handbook are enclosed in an *openPGP* block that is signed with the Frafos private release key. This signature can be verified with the public key that is exchanged via a secure communication channel.

The TOE can be uniquely identified by the SHA-256 checksums listed above.

The TOE consists of the secunet SBC Container, the detached signature file and the guidance document as well as the guidance detached signature file. The secunet SBC is delivered as a digitally signed container to assure the integrity and authenticity of its components. It is not required to ensure the confidentiality of the secunet SBC Container, therefore a digital signature complies with the requirements and no further mechanisms is in place.

Delivery Preconditions:

- Before the delivery itself is performed, the customer and Frafos need to establish a secure connection channel. For this task, the Frafos project manager and the customer exchange their PGP keys and verify the fingerprint in person or by phone. The keys are stored securely.
- After this the customer creates an account on the Frafos “NextCloud” server and sends his account name to the Frafos project manager. The account is then assigned permission to access a specific shared directory, which will contain the released files.
- The public Frafos Release Key (pgp-key) is sent to the customer via a PGP-encrypted email.

The Container build process is controlled by a SINA workstation connected via the build network to the build server. After a container is built by the developer, it is signed by the project manager on the build server. Afterwards it is stored on a USB stick connected to the SINA workstation together with the digital signature. Both, container and signature then are transferred from the USB stick to a regular workstation and uploaded to the “NextCloud” delivery server. The customer is informed about the upload via the secure PGP-channel, so that the released files can be downloaded by the customer. These steps are executed by the project manager.

The integrity can be checked by a checksum of the delivered item. The authenticity is ensured by the signed hash values and the public verification key in the above mentioned files. Therefore, after delivery, the detached digital signature of the container has to be verified. The person responsible for verifying the delivery shall test the signature with the help of the trusted public verification key and a reliable tool. If the verification fails, the container must not be used at all and a new delivery process has to be triggered.

### 3. Security Policy

The security policy enforced by the TOE is defined by the selected set of Security Functional Requirements and implemented by the TOE functionality. The TOE implements logical security functionality in order to perform data inspection and protect user data by filtering SIP headers and media stream containers. Hence the TOE maintains integrity and confidentiality of code and data stored in its memories by the correct operation of the security functionality provided by the TOE. Therefore the TOE' s policy is to protect against malfunction, leakage and manipulation. Besides, the TOE' s life cycle is supported as well

as the user Identification whereas the abuse of functionality is prevented. Specific details concerning the above mentioned security policies can be found in [6], chapter 3.

## 4. Assumptions and Clarification of Scope

The Assumptions defined in the Security Target and some aspects of Threats and Organisational Security Policies are not covered by the TOE itself. These aspects lead to specific security objectives to be fulfilled by the TOE-Environment. The topics in the Security Target [6], chapter 4.2. are of relevance.

## 5. Architectural Information

The TOE is executed as a systemd-spawn container on a hardened Linux operating system platform, such as a secunet wall. This operating system platform protects the integrity of the TOE. The integrity check of container is the first step of initialization. The main purpose of the secunet SBC Container is the initiation of a secure SIP session (also called signaling) and media communication streams such as RTP or SRTP. To protect the internal network the TOE perform data inspection and filtering on several protocol levels.

The security functions of the TOE are:

- SF.PacketFiltering
- SF.Management
- SF.Authentication
- SF.Logging

According to the TOE design specification these security functions are enforced by the following subsystems:

- Signaling and processing (SF.PacketFiltering)
- Configuration (SF.Management)
- User management and authentication (SF.Management, SF.Authentication)
- Logging (SF.Logging)

## 6. Documentation

The evaluated documentation as outlined in table 2 is being provided with the product to the customer. This documentation contains the required information for secure usage of the TOE in accordance with the Security Target.

Additional obligations and notes for secure usage of the TOE as outlined in chapter 10 of this report have to be followed.

## 7. IT Product Testing

The developer specified and implemented test cases for each defined subsystem, modules and interface. Thus all subsystems are covered by several test cases and each SFR-enforcing module is covered by at least one test case.

For the tests of the TOE the developer used the test environment with two virtual machines. This test environment consists of an executable shell script that starts up the

virtual machines and initializes the complete test setup. The automated test cases are developed in C++. The test configuration takes place using file "config.txt" and includes the topology and IP addresses to be applied for the test scenario. A description of the test cases and the single steps which are done in the test execution is given in "index.html" and supplementary data in the "result tarball" as test reports. Altogether there are 198 test cases performed with each complete test execution.

### Testing Results

The results of the developer tests are documented and prove the correct implementation. All test cases were executed successfully and ended up with the expected test results.

## **7.1. Independent Testing**

The independent testing approach contains repetition of the developer test. Additionally the evaluators considered results from the RFC analysis. The TOE has five TSFI from which three TSFI are thoroughly tested. The other, interface 2 (configuration interface) is only accessible (OE.ManagementNetwork) from trusted personal (OE.Administrators) and well covered by developer tests. The SNMP interface is covered by two manual developer tests, which are also repeated by the evaluators.

For this re-certification, all developer tests were repeated by the evaluators. The evaluator tests were not repeated if they were not impacted by the changes of the TOE.

The TOE configuration is identical for operations on a generic Linux, i.e. on the secunet wall. Only one configuration exists for the TOE, which was subject to the independent testing.

The interfaces have been selected by their exposition to third parties. The evaluators also included interfaces where the interface could be offended by misconfiguration in the TOE environment. The tests cover the TSFI. The other SBC interfaces have been implicitly tested by administrating the TOE. Also these are only accessible to trusted personnel.

### Testing Result

The overall test result is that no deviations were found between the expected and the actual test results.

## **7.2. Vulnerability Analysis**

For the penetration tests assessment of 'Common Vulnerability Entries', code review and fuzzing were used. The evaluators retrieved the applied versions of reused libraries and retrieved known vulnerabilities. During code review and fuzzing the penetration testers identified interfaces at the attack surface and send patterns that could trigger implementation flaws. During overload scenario applicability of TOE reconfigurations and SFP enforcement have been checked. No vulnerabilities have been identified during these activities.

The test environment for penetration tests consist of the TOE, two Linux machines and an asterisk private branch exchange. For the independent tests at the evaluator's site one laptop running VMware and two virtual machines have been set up.

For penetration tests such as fuzzing relevant parts of the TOE have been compiled into the fuzzer framework of *llvm* and *gasoline*. For other tests the SBC container that contains the TOE has been used. Eight different attack scenarios have been tested.

### Penetration Test Result

The overall test result is that no deviations were found between the expected and the actual test results. No attack scenario with the attack potential high was actually successful in the TOE's operational environment as defined in [6]. This shows that all measures required by the developer are applied.

Testing and vulnerability assessment considered both the secunet wall and the Debian OS platforms. Other configurations have not been defined by the vendor and thus were not assessed. The results of the evaluation can only be applied on secunet SBC Container Version 5.2.11-2. Without a preceding evaluation, the extension of the results to other versions of the TOE is not possible.

## 8. Evaluated Configuration

This certification covers the following configurations of the TOE:

The TOE evaluated configuration is defined by the notation:

- secunet SBC Container
- The documents:
  - Secunet SBC Container Handbook
  - Security Target

To identify the TOE, the guidance document [9] is providing sufficient information about identification mechanisms in chapters 7.4.1 and 7.4.7. Additionally, see also chapter 2 of this report. The TOE is composed of the elements listed in the configuration list for the TOE [8].

The description of the required non-TOE hardware, software and firmware is described in chapter 1.3.4 of the Security Target [6] and repeated in chapter 4 of the guidance [9]. The secunet SBC Container as a software-only TOE needs a Linux operating system with the *systemd-nspawn* container management technology installed. The hardware remains fully controlled by the operating system. The connected networks have to be separated physically. This requirement is especially valid for a management network that is necessary needed for the management and the configuration of the TOE.

The secunet SBC Container is a software TOE which must be deployed on a hardened Linux operating system platform such as the secunet Wall of at least version 6.1.0. This operating system platform protects the integrity of the TOE.

## 9. Results of the Evaluation

### 9.1. CC specific results

The Evaluation Technical Report (ETR) [7] was provided by the ITSEF according to the Common Criteria [1], the Methodology [2], the requirements of the Scheme [3] and all interpretations and guidelines of the Scheme (AIS) [4] as relevant for the TOE.

The Evaluation Methodology CEM [2] was used for those components up to EAL 5 extended by advice of the Certification Body for components beyond EAL 5 and guidance specific for the technology of the product [4] (AIS 34).

As a result of the evaluation the verdict PASS is confirmed for the following assurance components:

- All components of the EAL 4 package including the class ASE as defined in the CC (see also part C of this report)
- The components ASE\_TSS.2, ALC\_FLR.2 and AVA\_VAN.5 augmented for this TOE evaluation.

The evaluation work performed for this certification procedure was carried out as a re-evaluation based on the certificate BSI-DSZ-CC-1089-V2-2022. The focus of this re-evaluation was on the change to Debian OS and several other functional changes.

The evaluation has confirmed:

- PP Conformance: None
- for the Functionality: Product specific Security Target  
Common Criteria Part 2 conformant
- for the Assurance: Common Criteria Part 3 conformant  
EAL 4 augmented by ASE\_TSS.2, ALC\_FLR.2 and AVA\_VAN.5

The results of the evaluation are only applicable to the TOE as defined in chapter 2 and the configuration as outlined in chapter 8 above.

## 9.2. Results of cryptographic assessment

The TOE does not include cryptographic mechanisms. Thus, no such mechanisms were part of the assessment.

## 10. Obligations and Notes for the Usage of the TOE

The documents as outlined in table 2 contain necessary information about the usage of the TOE and all security hints therein have to be considered. In addition all aspects of Assumptions, Threats and OSPs as outlined in the Security Target not covered by the TOE itself need to be fulfilled by the operational environment of the TOE.

The customer or user of the product shall consider the results of the certification within his system risk management process. In order for the evolution of attack methods and techniques to be covered, he should define the period of time until a re-assessment of the TOE is required and thus requested from the sponsor of the certificate.

If available, certified updates of the TOE should be used. If non-certified updates or patches are available the user of the TOE should request the sponsor to provide a re-certification. In the meantime a risk management process of the system using the TOE should investigate and decide on the usage of not yet certified updates and patches or take additional measures in order to maintain system security.

The assessment has a strict configuration mandated by the security guidance. Violation of guidance instructions to the administrators is prohibited. It enforces especially:

- deactivation of cluster config;
- no modification of daemon and service configurations;
- activation of topology hiding (for the inner SIP clients) by JSON configuration;
- no use of backreferences in regular expressions;
- adequate configuration of an external firewall with respect to SNMP, DNS, redis;
- careful configuration of rate limiting via CAPS.

The TOE is (principally) unable to protect clients from SIP digest authentication relay attacks. The TOE provides capabilities to limit call rates using CAPS, but finally this does not protect SIP clients against DoS attacks.

## 11. Security Target

For the purpose of publishing, the Security Target [6] of the Target of Evaluation (TOE) is provided within a separate document as Annex A of this report.

## 12. Regulation specific aspects (eIDAS, QES)

None

## 13. Definitions

### 13.1. Acronyms

<b>AIS</b>	Application Notes and Interpretations of the Scheme

<b>ST</b>	Security Target
<b>TOE</b>	Target of Evaluation
<b>TSF</b>	TOE Security Functionality
<b>VoIP</b>	Voice over IP

## 13.2. Glossary

**Augmentation** - The addition of one or more requirement(s) to a package.

**Collaborative Protection Profile** - A Protection Profile collaboratively developed by an International Technical Community endorsed by the Management Committee.

**Extension** - The addition to an ST or PP of functional requirements not contained in CC part 2 and/or assurance requirements not contained in CC part 3.

**Formal** - Expressed in a restricted syntax language with defined semantics based on well-established mathematical concepts.

**Informal** - Expressed in natural language.

**Object** - A passive entity in the TOE, that contains or receives information, and upon which subjects perform operations.

**Package** - named set of either security functional or security assurance requirements

**Protection Profile** - A formal document defined in CC, expressing an implementation independent set of security requirements for a category of IT Products that meet specific consumer needs.

**Security Target** - An implementation-dependent statement of security needs for a specific identified TOE.

**Semiformal** - Expressed in a restricted syntax language with defined semantics.

**Subject** - An active entity in the TOE that performs operations on objects.

**Target of Evaluation** - An IT Product and its associated administrator and user guidance documentation that is the subject of an Evaluation.

**TOE Security Functionality** - Combined functionality of all hardware, software, and firmware of a TOE that must be relied upon for the correct enforcement of the SFRs.

## C. Excerpts from the Criteria

For the meaning of the assurance components and levels the following references to the Common Criteria can be followed:

- On conformance claim definitions and descriptions refer to CC part 1 chapter 10.5
- On the concept of assurance classes, families and components refer to CC Part 3 chapter 7.1
- On the concept and definition of pre-defined assurance packages (EAL) refer to CC Part 3 chapters 7.2 and 8
- On the assurance class ASE for Security Target evaluation refer to CC Part 3 chapter 12
- On the detailed definitions of the assurance components for the TOE evaluation refer to CC Part 3 chapters 13 to 17
- The table in CC part 3 , Annex E summarizes the relationship between the evaluation assurance levels (EAL) and the assurance classes, families and components.

The CC are published at <https://www.commoncriteriaportal.org/cc/>

## **D. Annexes**

### **List of annexes of this certification report**

Annex A: Security Target provided within a separate document.

Note: End of report
