# 1 ST Introduction

This Security Target (ST) is built upon the Security IC Platform Protection Profile with Augmentation Packages [1]. Registered and Certified by Bundesamt für Sicherheit in der Informationstechnik (BSI) under the reference BSI-CC-PP-0084-2014.

This chapter presents the ST reference, the reference for the Target Of Evaluation (TOE), a TOE overview description and a description of the logical and physical scope of the TOE.

## 1.1. ST and TOE identifiers

|                |                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------|
| ST reference:  | FM1280 07 Dual Interface Smart Card Chip with IC Dedicated Software 2.77 Security Target Lite V1.2 |
| TOE reference: | FM1280 07 Dual Interface Smart Card Chip with IC Dedicated Software 2.77                           |

## 1.2. TOE overview

The TOE is FM1280 07 Dual Interface Smart Card Chip with IC Dedicated Software 2.77, in short of FM1280, developed by Shanghai Fudan Microelectronics. It can be widely and easily applied in various security fields such as banking and finance market, social security card, transport card, small-amount payment and security identification, etc.

The FM1280 consists of the IC Hardware, the IC Dedicated Software and the supporting documents.

The hardware is based on a CPU, memories of ROM, NVM and RAMs, and cryptographic coprocessors for execution and acceleration of symmetric and asymmetric cryptographic algorithms, security components and several communication interfaces.

The CPU is a Microprocessor that supports a 32-bit instruction set and security features. The on-chip memories are ROM, NVM and RAM. The NVM is a non-volatile memory that can be used to store not only data but also code. The data integrity and confidentiality stored in the ROM, NVM, System RAM, Coprocessor RAM is protected.

The FM1280 supports the following communication interfaces:

- ISO/IEC 14443 TYPE A contactless interface
- ISO/IEC 7816 contact interface.

The FM1280 has been designed to provide a platform for Security IC Embedded Software which ensures that the critical user data of the Composite TOE are stored and processed in a secure way. To this end the FM1280 has the following security features:

- Hardware coprocessor for TDES
- Hardware coprocessor for AES
- True Random Number Generator with protections
- Hardware for RSA support
- Protection against power and electronic magnetic analysis
- Protection against physical attacks

- Protection against perturbation attacks
- Memory access control
- Memory encryption
- Data and critical register protection
- Active shielding
- Security sensors
- Software library with cryptographic services

Some of these features can be controlled by the Security IC embedded software. The software library in the IC Dedicated Software has been designed to provide easy access to the hardware functions and to complement these.

The Driver is a part of the IC Dedicated Software. It provides API functions of NVM operations, IO operations and CRC calculation.

The documents include a FM1280 Security Preparatory Guidance, a FM1280 Security Programming Guidance, an Application Programming Interface for FMSH\_CryptoLib, an Application Programming Interface for Driver, and a FM1280 User Manual.

There is no non-TOE hardware, firmware and software required by TOE.

## **1.3. TOE description**

### **1.3.1. Physical scope**

The block diagram of the TOE hardware and software is depicted below.

**Figure 1 Block Diagram of FM1280 07 Dual Interface Smart Card Chip with Software**

The FM1280 includes the IC Hardware, the IC Dedicated Software and supporting documents for developers. The grey coloured blocks in IC hardware are the algorithm modules whose security is not claimed in this TOE. The IC Dedicated Software comprises of FMSH\_Cryptolib and Driver. The Dedicated Test Software is only used to support testing of the TOE and downloading IC Embedded Software at manufacturer sites. The code of download function is stored in ROM, and is disabled before TOE Delivery. The code of test function is downloaded into the NVM, and is completely removed from the memory after testing. Hence it is not a part of the TOE. The IC Embedded Software is provided by developers. It is not a part of the TOE neither.

### 1.3.1.1. TOE components

The TOE consists of the following components that are delivered to the composite product manufacturer:

**Table 1 TOE components table**

| Type                  | Name                                   | Version | Delivery form                                 |
|-----------------------|----------------------------------------|---------|-----------------------------------------------|
| IC Hardware           | FM1280                                 | 07      | Wafer, module in package with security labels |
| IC Dedicated Software | Firmware 2.77 including the following: |         |                                               |
|                       | FMSH_CryptoLib                         | 3.110   | On-chip ROM and NVM                           |

|          | AU library                                                     | 06    | Pre-installed in NVM      |
| Document | FM1280 07 Security Preparatory Guidance                        | V0.7  | PGP encrypted PDF file    |
|          | FM1280 07 Security Programming Guidance                        | V0.7  | PGP encrypted PDF file    |
|          | FM1280 07 Application Programming Interface for FMSH_CryptoLib | V0.3  | PGP encrypted PDF file    |
|          | FM1280 07 Application Programming Interface for Driver         | V0.2  | PGP encrypted PDF file    |
|          | FM1280 07 User Manual                                          | V1.3  | PGP encrypted PDF file    |

Application notes:

The TOE version is defined by the versions of IC hardware and IC dedicated software together. The IC hardware version is 07, and the IC Dedicated Software version, also named Firmware, is 2.77.

The head files and the link library are provided for the user to help them to their product. The head files include FM\_CryptoLib.h, FM\_CryptoLib\_struct.h, FM\_DriverLib.h and FM\_DriverDef.h. The link libraries are FM\_Firmware\_staticLib\_Crypto.lib and FM\_Firmware\_staticLib\_Driver.lib.

The PGP encrypted files are delivered by e-mail or storage media, such as USB flash disk or DVD.

### 1.3.2. Logical scope

#### 1.3.2.1. Hardware description

The hardware of the FM1280 has the following components:

- 32-bit secure low power microprocessor
- Memories:
  - NVM
  - ROM
  - RAM
- Physical Interfaces:
  - ISO/IEC 14443 Type A contactless interface
  - ISO/IEC 7816 contact interface supports T=0/T=1 protocol
- CRC Coprocessor
- True Random Number Generator
- DES/TDES Coprocessor
- AES Coprocessor
- PAE Coprocessor for RSA support
- Chinese Domestic Algorithm Coprocessor
- HASH
- Memory Management Unit (MMU)
- Timers

- Watch Dog Timer
- Clock and Reset management
- Security Controller and Environmental Detector Circuits, such as light sensors, temperature sensors, clock frequency monitors, voltage and glitch sensors and active shielding
- Components for test purpose:
  - Test control
  - RAM BIST for RAM testing
  - MBIST for NVM testing

The 32-bit secure low power microprocessor is designed specifically for the high volume memory smart card and embedded security application with the proven security features.

Memories consist of NVM, ROM and RAM.

The two physical communication interfaces consist of a contactless interface to support ISO/IEC 14443 protocol and a contact interface to support ISO/IEC 7816 protocol. Two interfaces are able to work concurrently or independently.

The CRC coprocessor supports CRC16 on ISO14443-A, CRC16 on CCITT and CRC32 on ISO3309. The security of the CRC is not claimed in this TOE.

True Random Number Generator provides true random numbers with high quality satisfied with AIS31.

DES/TDES Coprocessor is a hardware module for DES/TDES calculation with security features. The ES needs to use these APIs in secure ways according to the application's security need.

AES Coprocessor is a hardware module for AES calculation with security features. The ES needs to use these APIs in secure ways according to the application's security need.

PAE Coprocessor provides hardware acceleration for RSA calculation with security features.

The TOE contains crypto support for Chinese Domestic Algorithms. The security of these algorithms is not claimed in the TOE.

HASH is a function to map data of arbitrary size to data of fixed size. Its security is not claimed in this TOE.

The MMU provides the access service to memories. In the aspect of security, MMU provides memory access control, memory encryption, data integrity check and data bus masking.

The timer is a specialized type of clock for measuring time intervals. The TOE contains two 32-bit timers whose driver is able to be select from system clock and external clocks. Each of them is capable to work as two 16-bit timers.

The watchdog is used to detect and recover from CPU malfunctions. The CPU regularly resets the watchdog timer to prevent it from 'time out'.

Clock and reset management provides the management of the power and the clock of the TOE.

The sensors in the form of light, temperature voltage, glitch and clock frequency are provided to ensure that the TOE only works in a safe environment. The active shield covers the chip's surface to resist physical attacks. The data and code stored in the NVM, ROM and RAMs are encrypted and come with check bits.

The Test control, RAMBIST and MBIST are used for test purposes by the manufacturer. Their test functions are disabled before TOE delivery.

The TOE works in these three operation modes below,

- Org Mode
- Prog Mode
- User Mode

The Org Mode and Prog Mode are only for manufacturer to carry out production testing and initializing the TOE's configuration. The operation mode is changed into User Mode before the TOE delivery to the developers and it cannot return to other two operation modes. The access of the testing functions is disabled in User Mode.

#### **1.3.2.2. Software description**

The TOE provides the following cryptographic services to the Security IC embedded software which are claimed as security functions:

- TRNG
- TDES
- AES
- RSA

The TOE provides the following cryptographic services to the Security IC embedded software which are not claimed as security functions:

- DRNG
- DES
- HASH
- Chinese Domestic Algorithms

A remark must be made that the TOE only provides the functions of DRNG, DES, HASH and Chinese Domestic Algorithms which are not claimed as security functions.

The TOE provides high entropy random numbers to the Security IC embedded software from a true random number generator.

The TOE provides the following driver services to the Security IC embedded software:

- NVM operation, such as read, write, erase and data check
- Interface communications
- CRC

A remark must be made that the driver services have not been made to be resistant against attacks. When they are used in secure code sections additional security must be added.

## 1.4 Life cycle and delivery

The end-consumer environment of the TOE is phase 7 of the Security IC product life-cycle as defined in the PP [1]. In this phase the FM1280 is in usage by the end-consumer. Its method of use now depends on the Security IC Embedded Software. Examples of use cases are ID cards or Bank cards.

The scope of the assurance referring to the TOE's life cycle is limited to phases 2, 3 and 4. These phases are under the control of the TOE manufacturer. At the end of phase 4 the TOE components described in 1.3.1.1 are delivered to the Composite Manufacturer.

The embedded software is loaded on the NVM in Phase 3 and the load feature is disabled before the TOE is delivered to the users.

## 2. Conformance claim

This chapter presents conformance claim and the conformance claim rationale.

### 2.1. CC Conformance

This Security Target claims to be conformant to the Common Criteria version 3.1:

- Part 1 revision 5 [2].
- Part 2 revision 5 [3]
- Part 3 revision 5 [4]

For the evaluation will be used the methodology in Common Criteria Evaluation Methodology version 3.1 CEM revision 5 [5]

This security Target claims to be CC Part 2 extended and CC Part 3 conformant.

### 2.2. PP Claim

This Security Target claims **strict** conformance to the Security IC Platform Protection Profile, [1].

The TOE also provides additional functionality, which is not covered in [1].

### 2.3. Package claim

This Security Target claims conformance to the assurance package **EAL5** augmented with AVA\_VAN.5 and ALC\_DVS.2. This assurance level is in line with the Security IC Platform Protection Profile [1].

### 2.4. Conformance claim rationale

This TOE is equivalent to the conformance claim stated in a Security IC Platform Protection Profile [1].

### 3. Security problem definition

This chapter presents the threats, organisational security policies and assumptions for the TOE.

The Assets, Assumptions, Threats and Organisational Security Policies are completely taken from the Security IC Platform Protection Profile [1].

#### 3.1. Description of Assets

Since this Security Target claims conformance to the Security IC Platform Protection Profile [1], the assets defined in section 3.1 of the Protection Profile are applied.

#### 3.2. Threats

This Security Target claims conformance to the Security IC Platform Protection Profile [1]. The Threats that apply to this Security Target are defined in section 3.2 of the Protection Profile. The following table lists the threats of the Protection Profile.

**Table 2 Threats defined in the Protection Profile**

| <b>Threat</b>       | <b>Title</b>                            |
|---------------------|-----------------------------------------|
| T.Leak-Inherent     | Inherent Information Leakage            |
| T.Phys-Probing      | Physical Probing                        |
| T.Malfunction       | Malfunction due to Environmental Stress |
| T.Phys-Manipulation | Physical Manipulation                   |
| T.Leak-Forced       | Forced Information Leakage              |
| T.Abuse-Func        | Abuse of Functionality                  |
| T.RND               | Deficiency of Random Numbers            |

#### 3.3. Organisational security policies

This Security Target claims conformance to the Security IC Platform Protection Profile [1]. The Organisational Security Policies that apply to this Security Target are defined in section 3.3 of the Protection Profile, they are:

P.Process-TOE          Protection during TOE Development and Production

The following Organisational Security Policy is also taken from the PP [1] to facilitate the TOE crypto services:

P.Crypto-Service          Cryptographic services of the TOE

The TOE provides additional functionality, which is not covered in [1]. In accordance with Application Note 5 of [1] this functionality is added using the policy P.Add-Sec-Fun

P.Add-Sec-Fun          Additional Specific Security Functionality  
The TOE shall provide the following security functionality to the security IC embedded software:

- Memory access control

### 3.4. Assumptions

This Security Target claims conformance to the Security IC Platform Protection Profile [1]. The assumptions claimed in this Security Target defined in section 3.4 of the Protection Profile. They are specified below.

**Table 3 Assumptions defined in the Protection Profile**

| <b>Assumption</b> | <b>Title</b>                                               |
|-------------------|------------------------------------------------------------|
| A.Process-Sec-IC  | Protection during Packaging, Finishing and Personalisation |
| A.Resp-Appl       | Treatment of User Data                                     |

## 4. Security objectives

This chapter provides the statement of security objectives and the security objective rationale. For this chapter the Security IC Platform Protection Profile [1] can be applied completely. Only a short overview is given in the following.

### 4.1. Security objectives for the TOE

All objectives described in the section 4.1 of the Security IC Platform Protection Profile [1] are claimed for the TOE, these are:

**Table 4 Security objectives for the TOE defined in the Protection Profile**

| Security Objective  | Title                                           |
|---------------------|-------------------------------------------------|
| O.Phys-Manipulation | Protection against Physical Manipulation        |
| O.Phys-Probing      | Protection against Physical Probing             |
| O.Malfunction       | Protection against Malfunctions                 |
| O.Leak-Inherent     | Protection against Inherent Information Leakage |
| O.Leak-Forced       | Protection against Forced Information Leakage   |
| O.Abuse-Func        | Protection against Abuse of Functionality       |
| O.Identification    | TOE Identification                              |
| O.RND               | Random Numbers                                  |

The following additional security objectives are taken from the PP [1] for the provision of hardware based Cryptographic services:

| Security Objective | Title                            |
|--------------------|----------------------------------|
| O.TDES             | Cryptographic service Triple-DES |
| O.AES              | Cryptographic service AES        |

In addition the TOE defines the following objectives:

O.RSA          RSA functionality

The TOE shall provide secure cryptographic services implementing the RSA cryptographic algorithm for encryption and decryption.

O.MEM\_ACCESS    Memory Access Control

The TOE shall control access of CPU instructions to memory partitions based on logical address of the code. For different memory partitions, the access of CPU instructions could be none, readable, writable, executable or their combination.

### 4.2. Security objectives for the security IC embedded software

All security objectives for the Security IC Embedded Software environment described in section 4.2 of the Security IC Platform Protection Profile [1] are claimed for the TOE, these are:

Table 5 Security Objectives for the security IC embedded software environment defined in the Protection Profile

| Security Objective | Title                                       |
|--------------------|---------------------------------------------|
| OE.Resp-Appl       | Treatment of User Data of the composite TOE |

### 4.3. Security objectives for the operational environment

The security objectives for the operational environment that are claimed in this Security Target are the security objectives described in section 4.3 of the “Security IC Platform Protection Profile” [1], which are:

Table 6 Security Objectives for the operational environment defined in the Protection Profile

| Security Objective | Title                                             |
|--------------------|---------------------------------------------------|
| OE.Process-Sec-IC  | Protection during composite product manufacturing |

### 4.4. Security objectives rationale

Section 4.4 in the Protection Profile provides a rationale how the assumptions, threats and organisational security policies are addressed by the objectives. The table below shows this relationship.

| Assumption, Threat or Organisational Security Policy | Security Objective  |
|------------------------------------------------------|---------------------|
| A.Resp-Appl                                          | OE.Resp-Appl        |
| P.Process-TOE                                        | O.Identification    |
| A.Process-Sec-IC                                     | OE.Process-Sec-IC   |
| T.Leak-Inherent                                      | O.Leak-Inherent     |
| T.Phys-Probing                                       | O.Phys-Probing      |
| T.Malfunction                                        | O.Malfunction       |
| T.Phys-Manipulation                                  | O.Phys-Manipulation |
| T.Leak-Forced                                        | O.Leak-Forced       |
| T.Abuse-Func                                         | O.Abuse-Func        |
| T.RND                                                | O.RND               |

For the justification of the above mapping please refer to the Protection Profile.

The table below shows how the additional organisational security policies are addressed by objectives for the TOE.

| Assumption, Threat or Organisational Security Policy | Security Objective       |
|------------------------------------------------------|--------------------------|
| P.Add-Sec-Fun                                        | O.MEM_ACCESS             |
| P.Crypto-Service                                     | O.TDES<br>O.AES<br>O.RSA |

Note that O.TDES and O.AES have been taken from the PP [1]. The others have been added.

The objective O.MEM\_ACCESS implements specific security functionality as required by P.Add-Sec-Fun.

The objective O.RSA implement specific crypto services as required by P.Crypto-Service.

## **5. Extended Components Definitions**

This Security Target uses the extended security functional requirements defined in chapter 5 of the Security IC Platform Protection Profile [1].

This Security Target does not define extended components in addition to the Protection Profile.

## 6. Security requirements

This chapter presents the statement of security requirements for the TOE and the security requirements rationale. This chapter applies the Security IC Platform Protection Profile [1].

### 6.1. Definitions

In the next sections the following notation is used:

- The iteration operation is used when a component is claimed with varying operations, it is denoted by adding “[XXX]” to the component name.
- Refinement, selection or assignment operations are used to add details or assign specific values to components, they are indicated by italic text and explained in footnotes.

### 6.2. Security Functional Requirements (SFR)

To support a better understanding of the combination Security IC Platform Protection Profile vs. Security Target, the TOE Security Functional Requirements are presented in the following several different sections.

#### 6.2.1. SFRs derived from the Security IC Platform Protection Profile

The table below lists the Security Functional Requirements that are directly taken from the Security IC Platform Protection Profile.

| Security functional requirement | Title                                         |
|---------------------------------|-----------------------------------------------|
| FRU_FLT.2                       | “Limited fault tolerance“                     |
| FPT_FLS.1                       | “Failure with preservation of secure state”   |
| FMT_LIM.1                       | “Limited capabilities”                        |
| FMT_LIM.2                       | “Limited availability”                        |
| FAU_SAS.1                       | “Audit storage”                               |
| FPT_PHP.3                       | “Resistance to physical attack”               |
| FDP_ITT.1                       | “Basic internal transfer protection”          |
| FDP_IFC.1                       | “Subset information flow control”             |
| FPT_ITT.1                       | “Basic internal TSF data transfer protection” |
| FDP_SDC.1                       | “Stored data confidentiality”                 |
| FDP_SDI.2                       | “Stored data integrity monitoring and action” |
| FCS_RNG.1                       | “Quality metric for random numbers”           |

Application note: FCS\_COP.1 and FCS\_CKM.4 are also from PP0084 and described in section 6.2.2.

Application note: For FPT\_FLS.1 there are 2 secure states, CPU halt and chip reset. When the external voltage is below the voltage safe range but above the power-down voltage level and when instruction fault is detected, the secure state is CPU halt. For the rest malfunctions, the secure state is chip reset.

Application note: For FPT\_FLS.1 there are 2 automatic responses, CPU halt and chip reset. When the external voltage is below the voltage safe range but above the power-down voltage level and when instruction fault is detected, the automatic response is CPU halt. For the rest malfunctions , the automatic response is chip reset.

Except for FAU\_SAS.1, FDP\_SDC.1, FDP\_SDI.2 and FCS\_RNG.1 all assignment and selection operations are defined in the Protection Profile.

- ☐ In FAU\_SAS.1 the left open assignment is the type of persistent memory;
- ☐ In FDP\_SDC.1 the left open assignment is the memory area;
- ☐ In FDP\_SDI.2 the left open assignments are the user data attributes and the action to be taken;
- ☐ In the FCS\_RNG.1 the left open definition is the quality metric for the random numbers.

The following statements define these completed SFRs.

**FAU\_SAS.1**                      Audit storage  
Hierarchical to:                No other components.  
FAU\_SAS.1.1                    The TSF shall provide *the test process before TOE Delivery*<sup>1</sup> with the capability to store *the Initialisation Data and/or Pre-personalisation Data*<sup>2</sup> in the OTP<sup>3</sup>.  
Dependencies:                    No dependencies.

**FDP\_SDC.1**                      Stored data confidentiality  
Hierarchical to:                No other components.  
FDP\_SDC.1.1                    The TSF shall ensure the confidentiality of the information of the user data while it is stored in the *ROM, NVM and part of the RAMs*<sup>4</sup>.  
Dependencies:                    No dependencies.

Application note:                The confidentiality of user data stored in the NVM, System RAM and Coprocessor RAM is provided. The confidentiality of user data stored in CLA RAM is not claimed.

**FDP\_SDI.2**                      Stored data integrity monitoring and action  
Hierarchical to:                FDP\_SDI.1 Stored data integrity monitoring  
FDP\_SDI.2.1                    The TSF shall monitor user data stored in containers controlled by the TSF for *parity errors or error correction errors or inconsistency between stored data and complementary bits or copy bits*<sup>5</sup> on all objects, based on the following attributes: *parity bits, error correction bits, complementary bits, or copy bits*<sup>6</sup>.  
FDP\_SDI.2.2                    Upon detection of a data integrity error, the TSF shall *reset*<sup>7</sup>.

---

<sup>1</sup>[assignment: list of subjects]

<sup>2</sup>[assignment: list of audit information]

<sup>3</sup>[assignment: type of persistent memory]

<sup>4</sup>[assignment: memory area]

<sup>5</sup>[assignment: integrity errors]

<sup>6</sup>[assignment: user data attributes]

<sup>7</sup>[assignment: action to be taken]

Dependencies: No dependencies.

**FCS\_RNG.1** Random number generation

Hierarchical to: No other components.

FCS\_RNG.1.1 The TSF shall provide a *physical*<sup>8</sup> random number generator that Implements:

- (PTG.2.1) A total failure test of the entropy source immediately when the RNG has started. When a total failure is detected, no random numbers will be output.
- (PTG.2.2) If a total failure of the entropy source occurs while the RNG is being operated, the RNG prevents the output of any internal random number that depends on some raw random numbers that have been generated after the total failure of the entropy source<sup>9</sup>.
- (PTG.2.3) The online test shall detect non-tolerable statistical defects of the raw random number sequence (i) immediately when the RNG has started, and (ii) while the RNG is being operated. The TSF must not output any random numbers before the power-up online test has finished successfully or when a defect has been detected.
- (PTG.2.4) The online test procedure shall be effective to detect non-tolerable weaknesses of the random numbers soon.
- (PTG.2.5) The online test procedure checks the quality of the raw random number sequence. It is triggered externally<sup>10</sup>. The online test is suitable for detecting non-tolerable statistical defects of the statistical properties of the raw random numbers within an acceptable period of time<sup>11</sup>

FCS\_RNG.1.2 The TSF shall provide octets of bits<sup>12</sup> that meet:

- (PTG.2.6) Test procedure A[6] and no other test suites<sup>13</sup> does not distinguish the internal random numbers from output sequences of an ideal RNG.
- (PTG.2.7) The average Shannon entropy per internal random bit exceeds 0.997.

Dependencies: No dependencies.

Application note: Online testing is triggered by an API invocation.

## 6.2.2. SFRs regarding cryptographic functionality

**FCS\_COP.1[TDES]** Cryptographic operation - Triple-DES

Hierarchical to: No other components.

FCS\_COP.1.1[TDES] The TSF shall perform *encryption and decryption*<sup>14</sup> in accordance with a specified cryptographic algorithm *TDES in ECB and CBC mode*<sup>15</sup> and

---

<sup>8</sup>[selection: *physical, non-physical true, deterministic, hybrid physical, hybrid deterministic*]

<sup>9</sup>[selection: prevents the output of any internal random number that depends on some raw random numbers that have been generated after the total failure of the entropy source, generates the internal random numbers with a post-processing algorithm of class DRG.2 as long as its internal state entropy guarantees the claimed output entropy].

<sup>10</sup> [selection: externally, at regular intervals, continuously, applied upon specified internal events].

<sup>11</sup> [assignment: list of security capabilities].

<sup>12</sup>[selection: bits, octets of bits, numbers [assignment: format of the numbers]]

<sup>13</sup>[assignment: additional standard test suites]

<sup>14</sup>[assignment: list of cryptographic operations]

<sup>15</sup>[assignment: cryptographic algorithm]

|                        |                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                        | cryptographic key sizes of <i>112 bit and 168 bit</i> <sup>16</sup> that meet the following <i>NIST SP800-67</i> [7], <i>NIST SP800-38A</i> <sup>17</sup> [8].                                                                                                                                                                                   |
| Dependencies:          | [FDP_ITC.1 Import of user data without security attributes, or<br>FDP_ITC.2 Import of user data with security attributes, or<br>FCS_CKM.1 Cryptographic key generation]<br>FCS_CKM.4 Cryptographic key destruction                                                                                                                               |
| Application note:      | The TOE also supports single DES. However, the security of the single DES algorithm is not resistant against attacks with a high attack potential. Therefore, the application of single DES shall not be used in parts of the Security Embedded Software that require high security.                                                             |
| <b>FCS_CKM.4[TDES]</b> | Cryptographic key destruction - TDES                                                                                                                                                                                                                                                                                                             |
| Hierarchical to:       | No other components.                                                                                                                                                                                                                                                                                                                             |
| Dependencies:          | FDP_ITC.1 Import of user data without security attributes, or<br>FDP_ITC.2 Import of user data with security attributes, or<br>FCS_CKM.1 Cryptographic key generation]                                                                                                                                                                           |
| FCS_CKM.4.1[TDES]      | The TSF shall destroy cryptographic keys in accordance with a specified cryptographic key destruction method <i>overwriting the internally stored key</i> <sup>18</sup> that meets the following: <i>none</i> <sup>19</sup> .                                                                                                                    |
| <b>FCS_COP.1[AES]</b>  | Cryptographic operation - AES                                                                                                                                                                                                                                                                                                                    |
| Hierarchical to:       | No other components.                                                                                                                                                                                                                                                                                                                             |
| FCS_COP.1.1[AES]       | The TSF shall perform <i>encryption and decryption</i> <sup>20</sup> in accordance with a specified cryptographic algorithm <i>AES in ECB and CBC mode</i> <sup>21</sup> and cryptographic key sizes of <i>128 bit, 192 bit and 256 bit</i> <sup>22</sup> that meet the following <i>FIPS 197</i> [10], <i>NIST SP800-38A</i> <sup>23</sup> [8]. |
| Dependencies:          | [FDP_ITC.1 Import of user data without security attributes, or<br>FDP_ITC.2 Import of user data with security attributes, or<br>FCS_CKM.1 Cryptographic key generation]<br>FCS_CKM.4 Cryptographic key destruction                                                                                                                               |
| <b>FCS_CKM.4[AES]</b>  | Cryptographic key destruction - AES                                                                                                                                                                                                                                                                                                              |

### 6.2.3. SFRs regarding access control

The hardware of the TOE shall provide different permissions to the Security IC embedded software to enable the management of access to code and data. The Security Function Policy (SFP) *Memory Access Control Policy* uses the following definitions.

The **Subjects** are:

- The *Software* in the memories (including Security IC Embedded software) of the TOE accessing memory as part of their software execution. There are two *Software* Subjects: *API service Code* and *User Code*.  
The *API service Code* consists of FMSH\_CryptoLib and the Driver services for IC Embedded software.

The **Objects** are:

- *Memory Data* (including code) stored in memory. It includes *API service Code*, *User Code*, *User Data*, *User Sensitive Data*, *CFG Section Data*, *System RAM Data*, *Coprocessor RAM Data*, and *CLA RAM Data*.

The memory **Operations** are:

- *Read/write* data from and to memory,
- *Execute* code from memory

The **Security Attributes** are:

- *Data Area* (location of the data in memory)

---

<sup>26</sup>[assignment: list of cryptographic operations]

<sup>27</sup>[assignment: cryptographic key destruction method]

<sup>28</sup>[assignment: list of standards]

- *Code Area* (location of the code in memory)
- *Operation mode*, these can be *Org Mode*, *Prog Mode* and *User Mode*.
- *Access permission rights* (these can be “No access”, combination of “Executable”, “Read” or “Write”)

The TOE shall meet the requirements “Subset access control (FDP\_ACC.1)” as specified below.

**FDP\_ACC.1 Subset access control**

Hierarchical to: No other components.

FDP\_ACC.1.1 The TSF shall enforce the *Access Control Policy*<sup>29</sup> on  
 (1) *the subjects: API service Code and User Code*,  
 (2) *the objects: Memory Data*,  
 (3) *the operation: read, write and execute*<sup>30</sup>

Dependencies: FDP\_ACF.1 Security attribute based access control.

Application Note: The Access Control Policy shall be enforced by implementing a Memory Management Unit. Before a respective memory address is accessed, the Memory Management Unit checks if the memory operation is allowed.

The TOE shall meet the requirement “Security attribute based access control (FDP\_ACF.1)” as specified below.

**FDP\_ACF.1 Security attribute based access control**

Hierarchical to: No other components.

FDP\_ACF.1.1 The TSF shall enforce the *Access Control Policy*<sup>31</sup> to objects based on the following: all subjects and objects and the attributes *Code Area*, *Data Area* and *Access Permission Rights*<sup>32</sup>.

FDP\_ACF.1.2 The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed:  
*The operation is allowed if the Code Area and the Data Area match an entry in the current set of Access Permission Rights*<sup>33</sup>

FDP\_ACF.1.3 The TSF shall explicitly authorise access of subjects to objects based on the following additional rules: *none*<sup>34</sup>

FDP\_ACF.1.4 The TSF shall explicitly deny access of subjects to objects based on the following additional rules: *none*<sup>35</sup>.

Dependencies: FDP\_ACC.1 Subset access control FMT\_MSA.3 Static attribute

<sup>34</sup> [assignment: rules, based on security attributes, that explicitly authorise access of subjects to objects]

<sup>35</sup> [assignment: rules, based on security attributes, that explicitly deny access of subjects to objects]

### 6.3. Security Assurance Requirements (SAR)

The Security Assurance Requirements claimed for the TOE are the SARs claimed in section 6.2 of the Security IC Protection Profile [1].

This Security Target will be evaluated according to Security Target evaluation (Class ASE)

The Security Assurance Requirements for the evaluation of the TOE are the components in Assurance Evaluation level EAL5 augmented by the components ALC\_DVS.2 and AVA\_VAN.5. The table below shows the details of these assurance requirements.

**Table 7 TOE assurance requirements**

| Security assurance requirements       | Titles                         |
|---------------------------------------|--------------------------------|
| Class ADV: Development                |                                |
| ADV_ARC.1                             | Architectural design           |
| ADV_FSP.5                             | Functional specification       |
| ADV_IMP.1                             | Implementation representation  |
| ADV_INT.2                             | TSF internals                  |
| ADV_TDS.4                             | TOE design                     |
| Class AGD: Guidance documents         |                                |

#### 6.4.2. Dependencies of the SFRs

The dependencies for the SFRs claimed according to the Protection Profile are all satisfied in the set of SFRs claimed in the Protection Profile.

In the following table the dependencies of the SFRs claimed in addition to Protection Profile is indicated.

| Security functional requirement | Dependencies                                            | Fulfilled by security requirements in this Security Target |
|---------------------------------|---------------------------------------------------------|------------------------------------------------------------|
| FCS_COP.1[TDES]                 | FDP_ITC.1 or<br>FDP_ITC.2 or<br>FCS_CKM.1,<br>FCS_CKM.4 | See explanation below this table<br><br>FCS_CKM.4[TDES]    |
| FCS_CKM.4[TDES]                 | FDP_ITC.1 or<br>FDP_ITC.2 or<br>FCS_CKM.1,              | See explanation below this table                           |
| FCS_COP.1[AES]                  | FDP_ITC.1 or<br>FDP_ITC.2 or<br>FCS_CKM.1,<br>FCS_CKM.4 | See explanation below this table<br><br>FCS_CKM.4[AES]     |
| FCS_CKM.4[AES]                  | FDP_ITC.1 or<br>FDP_ITC.2 or                            | See explanation below this table                           |

|                |                                            |                                   |
|----------------|--------------------------------------------|-----------------------------------|
|                | FCS_CKM.1,                                 |                                   |
| FCS_COP.1[RSA] | FDP_ITC.1 or<br>FDP_ITC.2 or<br>FCS_CKM.1, | See explanation below this table  |
|                | FCS_CKM.4                                  | FCS_CKM.4[RSA]                    |
| FCS_CKM.4[RSA] | FDP_ITC.1 or<br>FDP_ITC.2 or<br>FCS_CKM.1, | See explanation below this table  |
| FDP_ACC.1      | FDP_ACF.1                                  | Fulfilled by FDP_ACF.1 in this ST |
| FDP_ACF.1      | FDP_ACC.1                                  | Fulfilled by FDP_ACC.1 in this ST |
|                | FMT_MSA.3                                  | See discussion below              |

The developer of the Security IC Embedded Software must ensure that the implemented additional security functional requirements FCS\_COP.1[TDES], FCS\_COP.1[AES] and FCS\_COP.1[RSA] are used as specified and that the User Data processed by the related security functionality is protected as defined for the application context.

The dependent requirements for FCS\_COP.1[TDES], FCS\_COP.1[AES], FCS\_COP.1[RSA], FCS\_CKM.4[TDES], FCS\_CKM.4[AES] and FCS\_CKM.4[TDES] address the appropriate management of cryptographic keys used by the specified cryptographic function. All requirements concerning these management functions shall be fulfilled by the environment (Security IC Embedded Software).

The functional requirements [FDP\_ITC.1, or FDP\_ITC.2 or FCS\_CKM.1] are not included in this Security Target since the TOE only provides a pure engine for encryption and decryption without additional features for the handling of cryptographic keys. Therefore, the Security IC Embedded Software must fulfil these requirements related to the needs of the realised application.

The SFR FMT\_MSA.3 is not necessary because the security attributes used to enforce the memory access control are fixed by the IC manufacturer.

### 6.4.3. Security Assurance Requirements (SAR)

The SARs as defined in section 6.3 are in line with the SARs in the Security IC Platform Protection Profile. The context of this ST is equivalent to the context described in the Protection Profile and therefore these SARs are also applicable for this ST.

## 7. TOE summary specification

This chapter provides general information to potential users of the TOE on how the TOE implements the Security Functional Requirements in terms of “Security Functionality”.

### 7.1. Protection against malfunction

Malfunctioning relates to the security functional requirements FRU\_FLT.2 and FPT\_FLS.1. The TOE meets these SFRs by a group of security measures that guarantee correct operation of the TOE.

The TOE ensures its correct operation and prevents any malfunction while the security IC embedded software is executed through an appropriate design of the TOE including environment sensors or detectors. The sensors or detectors measure the temperature, supplied voltage and glitch signals in it, clock frequency, and exposure to light. In case that any malfunction occurred, an alarm will be triggered. Any alarm will trigger a system reset except the low voltage alarm that will trigger a CPU Halt.

### 7.2. Protection against leakage

Leakages relate to the security functional requirements FDP\_ITT.1, FDP\_IFC.1 and FPT\_ITT.1. The TOE meets these SFRs by implementing secure transfer based on data bus masking and SCA countermeasures in the crypto coprocessors and crypto lib that provides logical protection against leakage.

### 7.3. Protection against physical attacks

Physical manipulation and probing relates to the security functional requirements FPT\_PHP.3, FDP\_SDC.1 and FDP\_SDI.2. The TOE meets this SFR by implementing security measures that provides physical protection against physical probing and manipulation.

The security measures protect the TOE against manipulation of

- (i) the hardware,
- (ii) the security IC embedded software in the NVM,
- (iii) the application data in the NVM and RAM including the configuration data.

It protects the integrity and confidentiality of User Data or TSF data against disclosure by physical probing when stored or while being processed by the TOE.

The protection of the TOE comprises different features within the design and construction, which make reverse-engineering and tamper attacks more difficult. These features comprise whole chip covered active shield, memory encryption, and data integrity protections for memories and critical registers.

## 7.4. Identification and prevent abuse of functionality

Abuse of functionality and Identification relates to the security functional requirements FMT\_LIM.1, FMT\_LIM.2 and FAU\_SAS.1. The TOE meets these SFRs by implementation of a configuration and mode protection mechanism that prevents abuse of test functionality delivered as part of the TOE. The Identification data is stored in the OTP.

The test functionality is not available to the user after delivery of the TOE to the Composite Manufacturer.

## 7.5. Random number generator

Random numbers relate to the security requirement FCS\_RNG.1. The TOE meets this SFR by providing a random number generator.

The random number generator is composed of entropy source, total failure test, start-up test, online test and post-processing circuits. The random number generator fulfils the AIS31 PTG.2[6].

## 7.6. Cryptographic encryption/decryption

The TOE provides the single and Triple-DES algorithm according to the *NIST SP800-67[1]* and *NIST SP800-38A[8]* Standard to meet the security requirement FCS\_COP.1[TDES]. The TOE implements the Triple-DES algorithm as defined by *NIST SP800-67* by means of a hardware coprocessor. It supports the DES algorithm with a single 56-bit key supporting both CBC and ECB mode. It supports the Triple-DES algorithm with three 56-bit keys (168 bit) for the 3-key Triple-DES or two 56-bit keys for 2-key Triple DES supporting both CBC and ECB mode. The keys for the DES algorithms shall be provided by the security IC embedded software.

The single DES algorithm should be used in secure way according to the application's security need.

The TOE provides the AES algorithm according to the *FIPS 197[10]* and *NIST SP800-38A[8]* Standard to meet the security requirement FCS\_COP.1[AES]. The TOE implements the AES algorithm as defined by *FIPS 197* by means of a hardware coprocessor. It supports the AES algorithm with 128-bit, 192-bit or 256-bit key supporting both CBC and ECB mode. The keys for the AES algorithms shall be provided by the security IC embedded software.

The TOE provides the RSA algorithm according to the *PKCS#1 V2.2[9]* Standard to meet the security requirement FCS\_COP.1[RSA]. The TOE implements the RSA algorithm as defined by *PKCS#1 V2.2* by means of the combination of a hardware RSA accelerator and the security IC embedded RSA software. It supports RSA encryption and decryption from 256 bits to 2048 bits(step 64 bits). The signature generation and decryption can be performed by either a straightforward method or a CRT (Chinese Remainder Theorem) method. The keys for the RSA algorithm shall be provided by the security IC embedded software.

The TOE provides internal security measures for FCS\_CKM.4[TDES], FCS\_CKM.4[AES], FCS\_CKM.4[RSA] which clear memory areas used by the Crypto Library after usage. These measures ensure that a subsequent process may not gain access to cryptographic assets stored temporarily in memory used by the TOE.

## **7.7. Memory access control**

The TOE provides a Memory Management security function to the Security Embedded IC Software through the Memory Management Unit (MMU) to meet the Security Functional Requirements FDP\_ACC.1, FDP\_ACF.1.

The memory access is defined by both the fixed logic in MMU and configuration in OTP. Therefore, it cannot be modified from the embedded software.

## 8. Annexes

### 8.1. Glossaries

|                |                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| CLA            | Contactless interface supporting type A                                                                                           |
| FMSH_CryptoLib | A part of firmware, providing crypto related APIs for the users' invoking                                                         |
| FA             | Fault attack, a kind of attack to retrieve secret data or to bypass security checks by fault injection during Secure IC operation |
| Org Mode       | An operation mode of the TOE. This mode is used for NVM testing and initializing.                                                 |
| Prog Mode      | An operation mode of the TOE. This mode is used for initialize the configuration and download program and data after manufacture. |
| User Mode      | An operation mode of the TOE. The TOE is delivered in this mode.                                                                  |
