1 SECURITY TARGET INTRODUCTION

This Security Target (ST) defines the scope of the evaluation in terms of the assumptions made, the intended environment for the Target of Evaluation (TOE), the Information Technology (IT) security functional and assurance requirements to be met, and the level of confidence (evaluation assurance level) to which it is asserted that the TOE satisfies its IT security requirements. This document forms the baseline for the Common Criteria (CC) evaluation.

1.1 DOCUMENT ORGANIZATION

Section 1, ST Introduction, provides the Security Target reference, the Target of Evaluation reference, the TOE overview and the TOE description.

Section 2, Conformance Claims, describes how the ST conforms to the Common Criteria and Packages. The ST does not conform to a Protection Profile.

Section 3, Security Problem Definition, describes the expected environment in which the TOE is to be used. This section defines the set of threats that are relevant to the secure operation of the TOE, organizational security policies with which the TOE must comply, and secure usage assumptions applicable to this analysis.

Section 4, Security Objectives, defines the set of security objectives to be satisfied by the TOE and by the TOE operating environment in response to the problem defined by the security problem definition.

Section 5, Extended Components Definition, defines the extended components which are then detailed in Section 6.

Section 6, Security Requirements, specifies the security functional and assurance requirements that must be satisfied by the TOE and the IT environment.

Section 7, TOE Summary Specification, describes the security functions that are included in the TOE to enable it to meet the IT security functional requirements.

Section 8 Terminology and Acronyms, defines the acronyms and terminology used in this ST.

1.2 SECURITY TARGET REFERENCE

ST Title: NetMotion Mobility® 12.14 Security Target
ST Version: 0.15
ST Date: 15 October 2021

1.3 TOE REFERENCE

TOE NetMotion Mobility® 12.14

Identification:

- NetMotion Mobility Server 12.14.09178
- NetMotion Mobility 12.12 Client for Windows 10 (12.12.16943)
- NetMotion Mobility 12.12 Client for Android (12.12.16943)
- NetMotion Mobility 12.13 Client for macOS (12.13.23250)
- NetMotion Mobility 12.13 Client for iOS (12.13.05677)

TOE Developer: NetMotion Software, Inc.

TOE Type: Virtual Private Network (VPN)

Note: To satisfy the cryptographic requirements, the Android client will be running the NetMotion Mobility 12.12 software in the evaluated configuration of the TOE. This client software is fully compatible with the NetMotion Mobility Server 12.14 software.

1.4 TOE OVERVIEW

The TOE is NetMotion Mobility 12.14, a client/server-based software Virtual Private Network (VPN) that secures communications between the enterprise network and the mobile environment. NetMotion Mobility allows TCP/IP network applications to operate reliably and confidentially, without modification, over wireless connections. NetMotion Mobility ensures that only authorized users are granted access to protected resources, and that all communications are protected using validated cryptographic standards.

When a mobile device goes out of range or suspends operation, NetMotion Mobility maintains the session status and resumes the protected session when the device returns to service. If the mobile device returns to service at a different point on the network or connects from a new location, the Mobility server relays data to the new location, even if it is on a different subnet or a different network.

The TOE is managed via the Mobility Console, which is a web-based configuration and management application used by an administrator to configure settings, monitor server status and client connections, monitor activity or event

logs¹, and troubleshoot problems. The Mobility Console is part of the Mobility Server. Figure 1 identifies the TOE components in the evaluated configuration.

Figure 1 - NetMotion Mobility 12.14

1.4.1 TOE Environment

1.4.1.1 Required Non-TOE Components

The following hardware and software components are required to support the operation of the TOE in the evaluated configuration.

| TOE Component | Required Software | Required Hardware |
|---|---------------------|--|
| NetMotion Mobility 12.14 Server, version 1809 | Windows Server 2019 | General Purpose Computing Platform with x64-compatible dual-core processor, 2.0 GHz, 16 GB RAM |
| NetMotion Mobility 12.12 Windows Client, version 1909 | Windows 10 | General Purpose Computing Platform |
| NetMotion Mobility 12.13 iOS Client | iOS 13.6.1 | iPad, iPhone (Apple devices with Apple A8 to A12X CPUs) |

¹ An event log is a binary file updated by any Mobility component that logs event messages.

| TOE Component | Required Software | Required Hardware |
|--|-------------------|--|
| NetMotion Mobility 12.13 macOS Client | macOS 10.15 | Mac mini, iMac, MacPro or MacBook hardware (Intel CPUs) |
| NetMotion Mobility 12.12 Android Client | Android 11 | General Purpose Android device |

Table 1 - TOE-Supporting Hardware and Software

1.4.1.2 Required Operational Environment Components

The following environmental components are required for operation of the TOE in the evaluated configuration.

| Component | Required Software | Required Hardware |
|---|---|--|
| Management Console | Windows 10 with Microsoft Edge 52 or later | General Purpose Computing Platform |
| RADIUS Authentication Server (provided as a service to the TOE) | Software supporting PEAP MS-CHAPv2 and EAP-TLS | General Purpose Computing hardware that meets the requirements of the authentication server |
| Public Key Infrastructure (provided as a service to the TOE) | Dependent upon the authentication server | General Purpose Computing hardware that meets the requirements of the authentication server |
| Firewall | Dependent on the selected appliance | General Purpose Firewall appliance |

Table 2 - Operational Environment Hardware and Software

The operational environment must provide an authentication server. For the purposes of the evaluation, end-user authentication is performed using a RADIUS-based authentication server and an implementation of the PEAP MS-CHAPv2 or EAP-TLS protocols.

NTLMv2 over HTTPS is used to authenticate administrative users to the Mobility Console for the purposes of managing the TOE. Both the authentication server and the management console computer are located on a trusted internal network. Physical access to the management console computer must be limited to authorized personnel. A firewall must be in place to ensure that the Mobility Console can only be accessed from the internal network. This configuration allows NTLMv2 over HTTPS to provide sufficient security to support the authentication of administrative users.

Support for NTLM authentication of administrators is provided by the Windows infrastructure in the operational environment. In order to support the implementation of PEAP MS-CHAPv2 or EAP-TLS, one or more RADIUS authentication servers are required. Additionally, the use of EAP-TLS requires that users be issued certificates. These may be issued in any number of ways,

either from within the organization, or externally. A Public Key Infrastructure (PKI) is required to issue certificates.

In the evaluated configuration, a firewall must be implemented to protect the internal resources from the external network, which includes the Mobility Server and authentication server. The only access allowed from the wireless access point to the internal network is through a Mobility-protected VPN connection. Note that for authentication, an encrypted tunnel is established between the Mobility Client and the authentication server. The ciphersuites are negotiated between the client operating system and the authentication server. Once authenticated, a VPN tunnel is established between the Mobility Client and the Mobility Server. The ciphersuites used are negotiated between the Mobility Client and the Mobility Server.

The connections between the Mobility Server and the authentication servers are protected by the operational environment. These components may be physically secured in a server room and may communicate on the same Local Area Network (LAN) segment.

1.4.1.3 Cryptographic Components

The TOE calls cryptographic modules implemented within the server (Windows Server 2019) and client platforms (Windows 10, iOS 13, macOS 10.15 and Android 11) to perform cryptographic operations. The implementation of the cryptographic primitives and related key management are part of the operational environment and are not covered in the evaluation. Table 3 identifies the cryptographic modules for each platform:

| Platform | Cryptographic Module |
|----------------------------|--|
| Windows Server 2019 1809 | Microsoft Kernel Mode Cryptographic Primitives Library: Version 10.0.17763 |
| Windows 10 1909 | Microsoft Kernel Mode Cryptographic Primitives Library: Version 10.0.18363 |
| Apple iOS 13.6.1 | Apple CoreCrypto Kernel Module V10.0 for ARM: Version 10.0 |
| Apple macOS Catalina 10.15 | Apple CoreCrypto Kernel Module V10.0 for Intel: Version 10.0 |
| Android 11 | OpenSSL FIPS Object Module SE: Version 2.0.12 ² |

Table 3 - Cryptographic Modules in the Operational Environment

The TOE is a software-only TOE.

² Since no suitable cryptographic module exists in the Android operating system, the OpenSSL FIPS Object Module software is delivered to the device with the NetMotion client software.

1.5 TOE DESCRIPTION

1.5.1 Physical Scope

The TOE is NetMotion Mobility 12.14 and is comprised of the following components:

- NetMotion Mobility 12.14 Server
- NetMotion Mobility 12.12 Client for Windows
- NetMotion Mobility 12.13 Client for Apple iOS
- NetMotion Mobility 12.13 Client for macOS
- NetMotion Mobility 12.12 Client for Android

Figure 2 identifies the TOE Boundary.

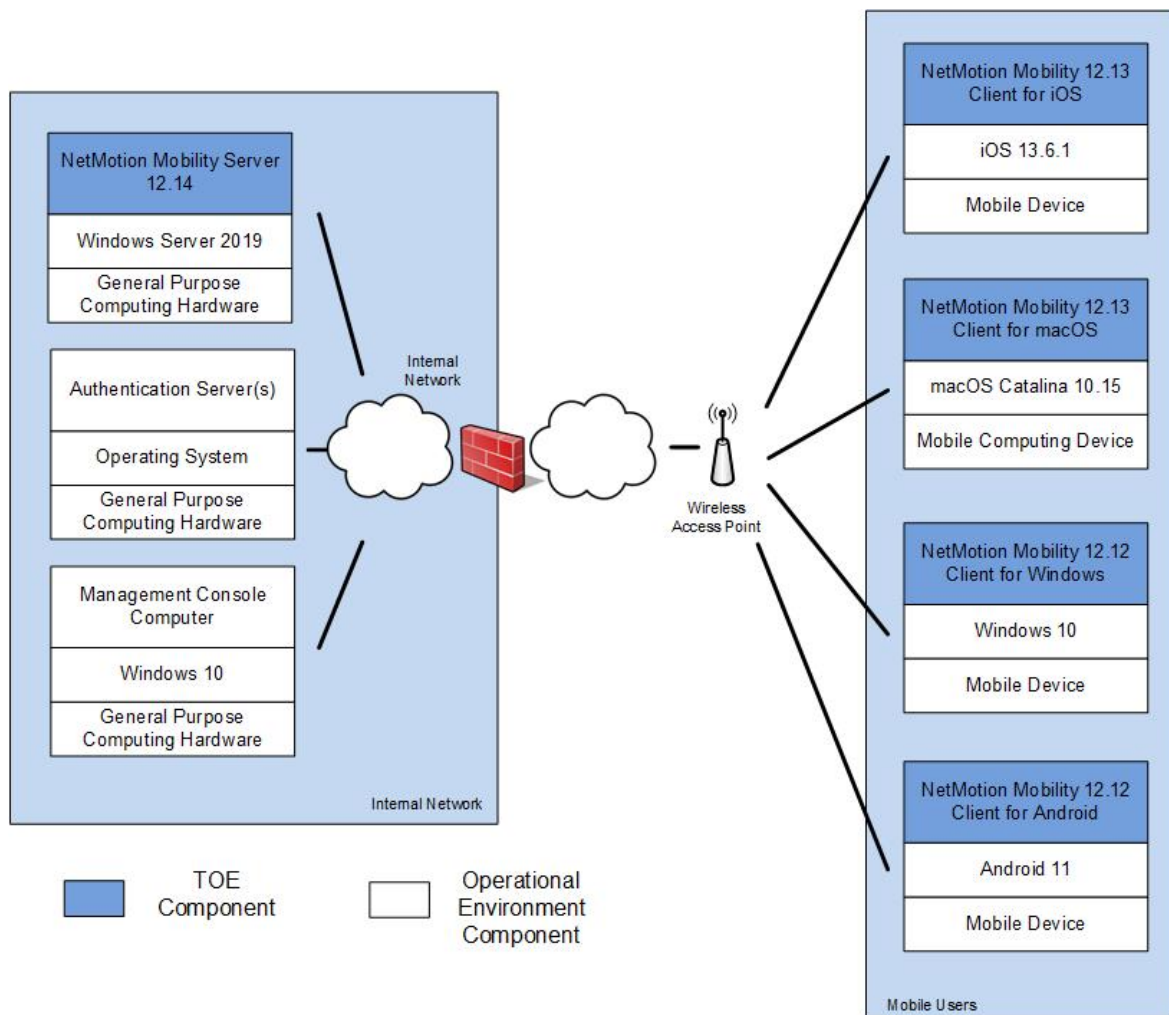

Figure 2 - NetMotion Mobility 12.14 TOE Boundary

1.5.2 TOE Delivery

1.5.2.1 Mobility Server and Windows Client

The NetMotion Mobility Server and Windows Client software are delivered to the customer via secure download. From the NetMotion Software website, customers are directed to a secure portal protected by TLS. Upon successful log in, customers can download the following executables:

- NetMotion Mobility 12.14 Server
 - `Mobility_Server_12.14_Win2016_release.exe`
- NetMotion Mobility 12.12 Windows Client
 - `Mobility_xg_client_12.12_Win10_x64_release.exe`

Customers can access the NetMotion Wireless portal at:

<http://www.netmotionwireless.com/customerportal>

1.5.2.2 Android, iOS, and macOS Client

The NetMotion Mobility Client software for Android, iOS and macOS devices is available via download from their respective app stores. Customers can download the following Mobility Client files:

- NetMotion Mobility 12.12 Android Client
 - `MobilityClient.apk`
- NetMotion Mobility 12.13 iOS Client
 - `MobilityXgiOS.ipa`
- NetMotion Mobility 12.13 macOS Client
 - `Mobility.app`

1.5.2.3 TOE Guidance

The TOE guidance documentation is provided in Hypertext Markup Language (HTML) format and is available to customers at:

<https://help.netmotionsoftware.com/support/docs/MobilityXG/1210/help/mobilityhelp.htm#page/Mobility%20Server/intro.01.02.html>

The following Common Criteria Guidance Supplement is also available to customers, in Portable Document Format (PDF), upon request:

- NetMotion Mobility® 12.14 Common Criteria Guidance Supplement
 - `NetMotion_Mobility_12_EAL4_AGD0.6.pdf`

1.5.3 Logical Scope

The logical boundary of the TOE includes all interfaces and functions within the physical boundary. The logical boundary of the TOE may be broken down by the security function classes described in Section 6. Table 4 summarizes the logical scope of the TOE.

| Functional Classes | Description |
|-----------------------------------|---|
| Security Audit | The TOE generates audit records for security events. Only those roles that have been granted specific access to the audit trail are able to view the audit records. For the purpose of this evaluation, only users in the Administrator role have been granted this access. |
| Cryptographic Support | The TOE supports secure communications between TOE components. This encrypted traffic prevents modification and disclosure of user information. Cryptographic functionality is provided by FIPS 140-2 validated modules in the operating systems of the server and client components. Cryptography is also supported for the authentication of users. |
| User Data Protection | The TOE provides an information flow security policy. The security policy limits access to internal protected resources based on policy settings. The TOE provides a secure connection between mobile users and the internal network. Traffic is protected from disclosure and modification. |
| Identification and Authentication | The TOE verifies that users are identified and authenticated before permitting access. Additionally, administrators must be identified and authenticated before access to administrative functions is permitted. |
| Security Management | The TOE provides security management functions through the Mobility Console. Administrators manage users, information flow policies, and audit records. |
| Protection of the TSF | Reliable timestamps are provided in support of TOE functions, including the generation of audit records. |

Table 4 – Logical Scope of the TOE

1.5.4 Functionality Excluded from the Evaluated Configuration

The following features are excluded from this evaluation:

- The data publisher
- NetMotion Replication Services
- Web Services API
- Unattended authentication mode
- Mobility Client API
- Mobility Event Viewer (on the Mobility Client)
- Mobility Network Access Control Module

2 CONFORMANCE CLAIMS

2.1 COMMON CRITERIA CONFORMANCE CLAIM

This Security Target claims to be conformant to Version 3.1 of Common Criteria for Information Technology Security Evaluation according to:

- Common Criteria for Information Technology Security Evaluation, Part 1: Introduction and General Model; CCMB-2017-04-001, Version 3.1, Revision 5, April 2017
- Common Criteria for Information Technology Security Evaluation, Part 2: Security Functional Components; CCMB-2017-04-002, Version 3.1, Revision 5, April 2017
- Common Criteria for Information Technology Security Evaluation, Part 3: Security Assurance Components CCMB-2017-04-003, Version 3.1, Revision 5, April 2017

As follows:

- CC Part 2 conformant
- CC Part 3 conformant

The Common Methodology for Information Technology Security Evaluation, Version 3.1, Revision 5, April 2017 has been taken into account.

2.2 PROTECTION PROFILE CONFORMANCE CLAIM

This ST does not claim conformance of the TOE with any Protection Profile (PP).

2.3 PACKAGE CLAIM

This Security Target claims conformance to Evaluation Assurance Level 4 augmented with ALC_FLR.2 Flaw Reporting Procedures.

2.4 CONFORMANCE RATIONALE

This ST does not claim conformance of the TOE with any PP, therefore a conformance rationale is not applicable.

3 SECURITY PROBLEM DEFINITION

3.1 THREATS

Table 5 lists the threats addressed by the TOE. The threat agents are considered to be unauthorized users with public knowledge of how the TOE operates, and who possess the skills and resources to alter TOE configuration settings, or parameters, or both. The threat agents do not have physical access to the TOE.

Mitigation to the threats is through the objectives identified in Section 4.1 - Security Objectives for the TOE.

| Threat | Description |
|-------------------|---|
| T.ACCESS | An unauthorized individual on an external network may access and exploit protected application data resources on an internal network. |
| T.NOAUTH | An unauthorized individual may gain access to the TOE security management functions and use this to allow unauthorized access to application data protected by the TOE. |
| T.SENSDATA | An unauthorized individual may be able to view or alter sensitive application data passed between a client and a server. |
| T.UNAUTH | An unauthorized user may gain access to the TOE and exploit system privileges to gain access to TOE security functions and application data. |

Table 5 – Threats

Application data refers to the data that passes between the end user and the server when the end user accesses the application remotely. The application may be any client/server application written for an IP network. Application data includes, but is not limited to, documents, spreadsheets, images, and XML data. Application data is considered to be at risk when it is transmitted on an external public network.

3.2 ORGANIZATIONAL SECURITY POLICIES

There are no Organizational Security Policies applicable to this TOE.

3.3 ASSUMPTIONS

The assumptions required to ensure the security of the TOE are listed in Table 6.

| Assumption | Description |
|----------------------|---|
| A.AUTH | The operational environment provides authentication services to the TOE. |
| A.CERTIFICATE | A PKI is available to issue certificates to users and servers. Root trust exists for the certificate chain. |
| A.INTERNAL | The internal network and its assets are protected from unauthorized access. A firewall must be in place to ensure that only authorized connections from Mobility Clients to the Mobility Server are permitted. |
| A.MANAGE | A management console computer is available on the internal protected network for the purposes of managing the TOE. Administrators will access the Mobility Console only from a management console computer on the internal network. |
| A.NOEVIL | Authorized administrators are non-hostile and follow all administrative guidance. |
| A.OS | The services, including cryptographic services, provided by the underlying operating system work correctly, and the operating system does not introduce any negative side effects to the TSF. |
| A.PHYSICAL | The server resources of the TOE will be located within controlled access facilities, which will prevent unauthorized physical access. |
| A.SECCOM | The communications between the TOE's Mobility Server and the authentication services, and between the TOE's Mobility Server and the management console computer are secured on an internal network. |

Table 6 – Assumptions

4 SECURITY OBJECTIVES

The purpose of the security objectives is to address the security concerns and to show which security concerns are addressed by the TOE, and which are addressed by the environment. Threats may be addressed by the TOE or the security environment or both. Therefore, the CC identifies two categories of security objectives:

- Security objectives for the TOE
- Security objectives for the environment

4.1 SECURITY OBJECTIVES FOR THE TOE

This section identifies and describes the security objectives that are to be addressed by the TOE.

| Security Objective | Description |
|--------------------|--|
| O.ACCESS | The TOE must regulate the flow of information from users on an external network to resources on an internal network, and must ensure that rules for granting access are enforced. |
| O.ACCOUNT | Users must be accountable for their use of the TOE and authorized administrators must be accountable for their use of TOE security management functions. |
| O.AUDIT | The TOE must record security relevant events, the date and time the events occurred, and provide a means to read this information. |
| O.ENCRYPT | The TOE must protect the confidentiality and integrity of information that flows between distributed TOE components. |
| O.IDENTIFY | The TOE must ensure that users are identified and authenticated using an approved authentication mechanism prior to allowing access to TOE functions and data. |
| O.SECFUN | The TOE must provide functionality that enables authorized administrators authenticated in the operational environment to manage the security functions of the TOE, and must ensure that only authorized administrators are able to access this functionality. |

Table 7 – Security Objectives for the TOE

4.2 SECURITY OBJECTIVES FOR THE OPERATIONAL ENVIRONMENT

This section identifies and describes the security objectives that are to be addressed by the IT environment or by non-technical or procedural means.

| Security Objective | Description |
|----------------------|--|
| OE.ADMIN | Authorized administrators are carefully screened during the selection process. All selected administrators are trained to appropriately install, configure, and maintain the TOE in its evaluated configuration according to the TOE guidance documentation. |
| OE.CONSOLEOS | The operating system on the management console computer that supports access to the Mobility Console will provide user authentication services. |
| OE.IDENTAUTH | The operational environment provides authentication services based on standard PEAP MS-CHAPv2 and EAP-TLS protocols, supported by trusted certificates. |
| OE.INTNETWORK | The operational environment will protect the internal network and its assets from access by unauthorized external entities through use of a firewall. |
| OE.PHYSICAL | Those responsible for the TOE must ensure that those parts of the TOE critical to the enforcement of security are protected from any physical attack. |
| OE.SECCOM | The operational environment will protect the communications between the TOE's Mobility server and the authentication servers, and between the TOE's Mobility Console on the Mobility server and the management console computer on a protected internal network. |
| OE.SUPPORT | The underlying operating system provides the correct services (including cryptographic services) to the TOE without introducing negative side effects on the TSF. |

Table 8 – Security Objectives for the Operational Environment

4.3 SECURITY OBJECTIVES RATIONALE

The following table maps the security objectives to the assumptions, threats, and organizational policies identified for the TOE.

| | T.ACCESS | T.NOAUTH | T.SENSADATA | T.UNAUTH | A.ATUH | A.CERTIFICATE | A.INTNETWORK | A.MANAGE | A.NOEVIL | A.OS | A.PHYSICAL | A.SECCOM |
|---------------|----------|----------|-------------|----------|--------|---------------|--------------|----------|----------|------|------------|----------|
| O.ACCESS | X | | | | | | | | | | | |
| O.ACCOUNT | | X | | | | | | | | | | |
| O.AUDIT | | X | | | | | | | | | | |
| O.ENCRYPT | | | X | | | | | | | | | |
| O.IDENTIFY | X | X | | X | | | | | | | | |
| O.SECFUN | | | | X | | | | | | | | |
| OE.ADMIN | | | | | | | | | X | | | |
| OE.CONSOLEOS | | | | X | | | | | | | | |
| OE.IDENTAUTH | | X | | | X | X | | | | | | |
| OE.INTNETWORK | | | | | | | X | | | | | |
| OE.PHYSICAL | | | | | | | | | | | X | |
| OE.SECCOM | | | | | | | | X | | | | X |
| OE.SUPPORT | | | | | | | | | X | | | |

Table 9 – Mapping Between Objectives, Threats, OSPs, and Assumptions

4.3.1 Security Objectives Rationale Related to Threats

The security objectives rationale related to threats traces the security objectives for the TOE and the Operational Environment back to the threats addressed by the TOE.

| | | |
|-----------------------------------|---|---|
| Threat: T.ACCESS | An unauthorized individual on an external network may access and exploit protected application data resources on an internal network. | |
| Objectives: | O.ACCESS | The TOE must regulate the flow of information from users on an external network to resources on an internal network, and must ensure that rules for granting access are enforced. |
| | O.IDENTIFY | The TOE must ensure that users are identified and authenticated using an approved authentication mechanism prior to allowing access to TOE functions and data. |
| Rationale: | O.ACCESS counters this threat by ensuring that the rules for access to protected resources are enforced. O.IDENTIFY ensures that users are identified and authenticated before gaining access to the TOE, thereby mitigating the risk of unauthorized access to protected resources. | |

| | | |
|-----------------------------------|---|--|
| Threat: T.NOAUTH | An unauthorized individual may gain access to the TOE security management functions and use this to allow unauthorized access to application data protected by the TOE. | |
| Objectives: | O.ACCOUNT | Users must be accountable for their use of the TOE and authorized administrators must be accountable for their use of TOE security management functions. |
| | O.AUDIT | The TOE must record security relevant events, the date and time the events occurred, and provide a means to read this information. |
| | O.IDENTIFY | The TOE must ensure that users are identified and authenticated using an approved authentication mechanism prior to allowing access to TOE functions and data. |
| | OE.IDENTAUTH | The operational environment provides authentication services based on standard PEAP MS-CHAPv2 and EAP-TLS protocols, supported by trusted certificates. |

| | |
|-------------------|---|
| Rationale: | <p>O.ACCOUNT ensures that users are held accountable for their use of the TOE.</p> <p>O.AUDIT ensures that the audit records supporting accountability are recorded, time stamped, and may be read using the TOE.</p> <p>O.IDENTIFY ensures that users are identified and authenticated prior to being allowed access to TOE functions.</p> <p>OE.IDENTAUTH ensures that the operational environment identifies and authenticates users, and provides this information to the TOE in support of the TOE objectives.</p> |
|-------------------|---|

| | | |
|-------------------------------------|--|--|
| Threat: T.SENSDATA | An unauthorized individual may be able to view or alter sensitive application data passed between a client and a server. | |
| Objectives: | O.ENCRYPT | The TOE must protect the confidentiality and integrity of information that flows between distributed TOE components. |
| Rationale: | O.ENCRYPT ensures that data that flows between components may not be read or altered by an unauthorized individual. | |

| | | |
|-----------------------------------|--|--|
| Threat: T.UNAUTH | An unauthorized user may gain access to the TOE and exploit system privileges to gain access to TOE security functions and application data. | |
| Objectives: | O.IDENTIFY | The TOE must ensure that users are identified and authenticated using an approved authentication mechanism prior to allowing access to TOE functions and data. |
| | O.SECFUN | The TOE must provide functionality that enables authorized administrators authenticated in the operational environment to manage the security functions of the TOE, and must ensure that only authorized administrators are able to access this functionality. |
| | OE.CONSOLEOS | The operating system on the management console computer that supports access to the Mobility Console will provide user authentication services. |
| Rationale: | <p>O.IDENTIFY ensures that users are identified and authenticated using an approved authentication mechanism before gaining access, thereby mitigating the risk of bypass of TOE security.</p> <p>O.SECFUN ensures that only authorized administrators are able to access TOE security management functionality.</p> <p>OE.CONSOLEOS ensures that the operational environment provides</p> | |

authentication services in support of Mobility Console access.

4.3.2 Security Objectives Rationale Related to Assumptions

The security objectives rationale related to assumptions traces the security objectives for the operational environment back to the assumptions for the TOE's operational environment.

| | | |
|-------------------------------|--|---|
| Assumption: A.AUTH | The operational environment provides authentication services to the TOE. | |
| Objectives: | OE.IDENTAUTH | The operational environment provides authentication services based on standard PEAP MS-CHAPv2 and EAP-TLS protocols, supported by trusted certificates. |
| Rationale: | OE.IDENTAUTH supports this assumption by ensuring that the operational environment provides authentication services. | |

| | | |
|--------------------------------------|--|---|
| Assumption: A.CERTIFICATE | A PKI is available to issue certificates to users and servers. Root trust exists for the certificated chain. | |
| Objectives: | OE.IDENTAUTH | The operational environment provides authentication services based on standard PEAP MS-CHAPv2 and EAP-TLS protocols, supported by trusted certificates. |
| Rationale: | OE.IDENTAUTH supports this assumption by ensuring that trusted certificates are available to support authentication. | |

| | | |
|-----------------------------------|--|---|
| Assumption: A.INTERNAL | The internal network and its assets are protected from unauthorized access. A firewall must be in place to ensure that only authorized connections from Mobility Clients to the Mobility Server are permitted. | |
| Objectives: | OE.INTNETWORK | The operational environment will protect the internal network and its assets from access by unauthorized external entities through use of a firewall. |
| Rationale: | OE.INTNETWORK supports this assumption by ensuring that the operational environment includes a firewall to protect the internal network and its assets against unauthorized access. | |

| | | |
|---------------------------------|---|--|
| Assumption: A.MANAGE | A management console computer is available on the internal protected network for the purposes of managing the TOE. Administrators will access the Mobility Console only from a management console computer on the internal network. | |
| Objectives: | OE.SECCOM | The operational environment will protect the communications between the TOE's Mobility server and the authentication servers, and between the TOE's Mobility Console on the Mobility server and the management console computer on a protected internal network. |
| Rationale: | OE.SECCOM supports this assumption by ensuring that communications between the TOE and administrators using the management console computer and between the TOE and the authentication server are protected. | |

| | | |
|---------------------------------|--|--|
| Assumption: A.NOEVIL | Authorized administrators are non-hostile and follow all administrative guidance. | |
| Objectives: | OE.ADMIN | Authorized administrators are carefully screened during the selection process. All selected administrators are trained to appropriately install, configure, and maintain the TOE in its evaluated configuration according to the TOE guidance documentation. |
| Rationale: | OE.ADMIN upholds the assumption A.NOEVIL by providing carefully selected administrators with the training required to be able to follow the administrative guidance. | |

| | | |
|-----------------------------|---|---|
| Assumption: A.OS | The services, including cryptographic services, provided by the underlying operating system work correctly, and the operating system does not introduce any negative side effects to the TSF. | |
| Objectives: | OE.SUPPORT | The underlying operating system provides the correct services (including cryptographic services) to the TOE without introducing negative side effects on the TSF. |
| Rationale: | OE.SUPPORT upholds the assumption A.OS by providing reliable services, including cryptographic services, to the TOE without the introduction of negative side effects. | |

| | | |
|-----------------------------------|---|---|
| Assumption: A.PHYSICAL | The server resources of the TOE will be located within controlled access facilities, which will prevent unauthorized physical access. | |
| Objectives: | OE.PHYSICAL | Those responsible for the TOE must ensure that those parts of the TOE critical to the enforcement of security are protected from any physical attack. |
| Rationale: | OE.PHYSICAL ensures that TOE server resources are protected from physical attack, thereby supporting the assumption of protection of the resources. | |

| | | |
|---------------------------------|--|--|
| Assumption: A.SECCOM | The communications between the TOE's Mobility Server and the authentication services, and between the TOE's Mobility Server and the management console computer are secured on an internal network. | |
| Objectives: | OE.SECCOM | The operational environment will protect the communications between the TOE's Mobility server and the authentication servers, and between the TOE's Mobility Console on the Mobility server and the management console computer on a protected internal network. |
| Rationale: | OE.SECCOM ensures that communications between the TOE (Mobility server) and the authentication servers, and between the TOE (Mobility Console on the Mobility server) and the management console computer are appropriately protected, as required by the assumption A.SECCOM. | |

5 EXTENDED COMPONENTS DEFINITION

5.1 SECURITY FUNCTIONAL REQUIREMENTS

This ST does not include extended Security Functional Requirements.

5.2 SECURITY ASSURANCE REQUIREMENTS

This ST does not include extended Security Assurance Requirements.

6 SECURITY REQUIREMENTS

Section 6 provides security functional and assurance requirements that must be satisfied by a compliant TOE. These requirements consist of functional components from Part 2 of the CC and an Evaluation Assurance Level (EAL) that contains assurance components from Part 3 of the CC.

6.1 CONVENTIONS

The CC permits four types of operations to be performed on functional requirements: selection, assignment, refinement, and iteration. These operations, when performed on requirements that derive from CC Part 2, are identified in this ST in the following manner:

- Selection: Indicated by surrounding brackets, e.g., [selected item].
- Assignment: Indicated by surrounding brackets and italics, e.g., [*assigned item*].
- Refinement: Refined components are identified by using **bold** for additional information, or ~~strikeout~~ for deleted text.
- Iteration: Indicated by assigning a number in parenthesis to the end of the functional component identifier as well as by modifying the functional component title to distinguish between iterations, e.g., 'FDP_ACC.1(1), Subset access control (administrators)' and 'FDP_ACC.1(2) Subset access control (devices)'.

6.2 SECURITY FUNCTIONAL REQUIREMENTS

The security functional requirements for this ST consist of the following components from Part 2 of the CC, summarized in Table 10.

| Class | Identifier | Name |
|-----------------------------|--------------|---|
| Security Audit (FAU) | FAU_GEN.1 | Audit data generation |
| | FAU_SAR.1 | Audit review |
| Cryptographic Support (FCS) | FCS_CKM.1(1) | Cryptographic key generation (AES) |
| | FCS_CKM.1(2) | Cryptographic key generation (RSA) |
| | FCS_CKM.1(3) | Cryptographic key generation (ECDH) |
| | FCS_CKM.1(4) | Cryptographic key generation (DH) |
| | FCS_CKM.4 | Cryptographic key Destruction |
| | FCS_COP.1(1) | Cryptographic operation (Windows) |
| | FCS_COP.1(2) | Cryptographic operation (iOS and macOS) |
| | FCS_COP.1(3) | Cryptographic operation (Android) |

| Class | Identifier | Name |
|---|------------|---------------------------------------|
| User Data Protection (FDP) | FDP_IFC.1 | Subset information flow control |
| | FDP_IFF.1 | Simple security attributes |
| | FDP_ITT.1 | Basic internal transfer protection |
| Identification and Authentication (FIA) | FIA_UAU.2 | User authentication before any action |
| | FIA_UAU.5 | Multiple authentication mechanisms |
| | FIA_UID.2 | User identification before any action |
| Security Management (FMT) | FMT_MTD.1 | Management of TSF data |
| | FMT_SMF.1 | Specification of Management Functions |
| | FMT_SMR.1 | Security roles |
| Protection of the TSF (FPT) | FPT_STM.1 | Reliable time stamps |

Table 10 – Summary of Security Functional Requirements

6.2.1 Security Audit (FAU)

6.2.1.1 FAU_GEN.1 Audit data generation

Hierarchical to: No other components.

Dependencies: FPT_STM.1 Reliable time stamps

FAU_GEN.1.1 The TSF shall be able to generate an audit record of the following auditable events:

- a) Start-up and shutdown of the audit functions;
- b) All auditable events for the [not specified] level of audit; and
- c) [*establishment of an encrypted session, client connection events, administrator logon to the Mobility Console*].

FAU_GEN.1.2 The TSF shall record within each audit record at least the following information:

- a) Date and time of the event, type of event, subject identity (if applicable), and the outcome (success or failure) of the event; and
- b) For each audit event type, based on the auditable event definitions of the functional components included in the PP/ST, [*device name*].

6.2.1.2 FAU_SAR.1 Audit review

Hierarchical to: No other components.

Dependencies: FAU_GEN.1 Audit data generation

FAU_SAR.1.1 The TSF shall provide [*Administrators*] with the capability to read [*all audit information*] from the audit records.

FAU_SAR.1.2 The TSF shall provide the audit records in a manner suitable for the user to interpret the information.

6.2.2 Cryptographic Support (FCS)

6.2.2.1 FCS_CKM.1(1) Cryptographic key generation (AES)

Hierarchical to: No other components.

Dependencies: [FCS_CKM.2 Cryptographic key distribution,
or FCS_COP.1 Cryptographic operation]
FCS_CKM.4 Cryptographic key destruction

FCS_CKM.1.1(1) The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [*Counter mode Deterministic Random Bit Generator (CTR-DRBG)*] and specified cryptographic key sizes [*128 or 256 bit*] that meet the following: [*NIST Special Publication 800-90A*].

6.2.2.2 FCS_CKM.1(2) Cryptographic key generation (RSA)

Hierarchical to: No other components.

Dependencies: [FCS_CKM.2 Cryptographic key distribution,
or FCS_COP.1 Cryptographic operation]
FCS_CKM.4 Cryptographic key destruction

FCS_CKM.1.1(2) The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [*Deterministic Random Bit Generator (DRBG)*] and specified cryptographic key sizes [*2048 bit*] that meet the following: [*NIST Special Publication 800-90A*].

6.2.2.3 FCS_CKM.1(3) Cryptographic key generation (ECDH)

Hierarchical to: No other components.

Dependencies: [FCS_CKM.2 Cryptographic key distribution,
or FCS_COP.1 Cryptographic operation]
FCS_CKM.4 Cryptographic key destruction

FCS_CKM.1.1(3) The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [*Random Bit Generator (RBG)*] and specified cryptographic key sizes [*p-256, p-384 and p-521*] that meet the following: [*FIPS 186-4 as referenced in NIST Special Publication 800-56A*].

6.2.2.4 FCS_CKM.1(4) Cryptographic key generation (DH)

- Hierarchical to: No other components.
- Dependencies: [FCS_CKM.2 Cryptographic key distribution, or FCS_COP.1 Cryptographic operation]
FCS_CKM.4 Cryptographic key destruction

FCS_CKM.1.1(4) The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [*Random Bit Generator (RBG)*] and specified cryptographic key sizes [*112, 128 bits*] that meet the following: [*FIPS 186-4 as referenced in NIST Special Publication 800-56A*].

6.2.2.5 FCS_CKM.4 Cryptographic key destruction

- Hierarchical to: No other components.
- Dependencies: [FDP_ITC.1 Import of user data without security attributes, or
FDP_ITC.2 Import of user data with security attributes, or
FCS_CKM.1 Cryptographic key generation]

FCS_CKM.4.1 The TSF shall destroy cryptographic keys in accordance with a specified cryptographic key destruction method [*zeroization*] that meets the following: [*FIPS 140-2 zeroization standards*].

6.2.2.6 FCS_COP.1(1) Cryptographic operation (Windows)

- Hierarchical to: No other components.
- Dependencies: [FDP_ITC.1 Import of user data without security attributes, or
FDP_ITC.2 Import of user data with security attributes, or
FCS_CKM.1 Cryptographic key generation] FCS_CKM.4 Cryptographic key destruction

FCS_COP.1.1(1) The TSF shall perform [*the cryptographic operations in Table 11*] in accordance with a specified cryptographic algorithm [*in Table 11*] and cryptographic key sizes [*in Table 11*] that meet the following: [*list of standards in Table 11*].

| Operation | Algorithm | Key Size (bits) | CAVP Certificate | Standard |
|---------------------------------|-----------|---------------------|------------------|--------------------------|
| Encryption and Decryption | AES CBC | 128, 256 | C211 | FIPS 197 |
| | AES GCM | | C1363 | SP 800-38A SP 800-38D |
| Key Agreement in support of VPN | EC DH | p-256, p-384, p-521 | C211 C1363 | NIST SP800-56A |

| Operation | Algorithm | Key Size (bits) | CAVP Certificate | Standard |
|---|-------------------------|-----------------|------------------|---------------------------|
| Secure Hash | SHA-256 | Not applicable | C211 | FIPS 180-4 |
| | SHA-384 | | C1363 | |
| Keyed-Hash Message Authentication Code (HMAC) | HMAC | 256, 384 | C211 C1363 | FIPS 198-1 |
| Asymmetric cryptography | RSA (RSASSA-PKCS1_V1_5) | 2048 | C211 C1363 | PKCS#1 v1.5 FIPS 186-4 |

Table 11 - Cryptographic Operations (Windows)

Application note: FCS_COP.1(1) applies to TOE components installed on Windows Server 2019 1809 and Windows 10 64-bit version using the Microsoft Kernel Mode Cryptographic Primitives Library (CNG.SYS) Software Version: 10.0.17763. AES GCM is only used in conjunction with user authentication.

6.2.2.7 FCS_COP.1(2) Cryptographic operation (iOS and macOS)

Hierarchical to: No other components.

Dependencies: [FDP_ITC.1 Import of user data without security attributes, or

FDP_ITC.2 Import of user data with security attributes, or

FCS_CKM.1 Cryptographic key generation] FCS_CKM.4 Cryptographic key destruction

FCS_COP.1.1(2) The TSF shall perform [*the cryptographic operations in Table 12*] in accordance with a specified cryptographic algorithm [*in Table 12*] and cryptographic key sizes [*in Table 12*] that meet the following: [*list of standards in Table 12*].

| Operation | Algorithm | Key Size (bits) | CAVP Certificate | Standard |
|---------------------------|--------------------|-----------------|---|--------------------------------------|
| Encryption and Decryption | AES CBC AES GCM | 128, 256 | For iOS: A6, A7, A8, A10, A11, A13, A14, A15 For macOS: A7, A8, A10, A11, A13, A15, A19, A20, A21, A23, A24, A25, A28, A31 | FIPS 197 SP 800-38A SP 800-38D |

| Operation | Algorithm | Key Size (bits) | CAVP Certificate | Standard |
|---|-------------------------|-----------------|---|---------------------------|
| Key Agreement in support of VPN | EC DH | P-256, P-384 | For iOS: A8 For macOS: A8 | NIST SP800-56A |
| Secure Hash | SHA-256 | Not applicable | For iOS: A8, A9, A12, A17, A18 For macOS: A8, A22, A26, A27, A29, A30, A32, A33, A34 | FIPS 180-4 |
| Keyed-Hash Message Authentication Code (HMAC) | HMAC | 384 | For iOS: A8, A9, A16, A18 For macOS: A8, A22, A26, A27, A29, A30, A32, A33, A34 | FIPS 198-1 |
| Asymmetric cryptography | RSA (RSASSA-PKCS1_V1_5) | 2048 | For iOS: A8, A9, A18 For macOS: A8, A22, A26, A27, A30, A33, A34 | PKCS#1 v1.5 FIPS 186-4 |

Table 12 - Cryptographic Operations (iOS and macOS)

Application note: FCS_COP.1(2) applies to TOE components installed on iOS 13.6.1, or Apple macOS 10.15. AES GCM is only used in conjunction with user authentication.

6.2.2.8 FCS_COP.1(3) Cryptographic operation (Android)

- Hierarchical to: No other components.
- Dependencies: [FDP_ITC.1 Import of user data without security attributes, or
FDP_ITC.2 Import of user data with security attributes, or
FCS_CKM.1 Cryptographic key generation] FCS_CKM.4 Cryptographic key destruction

FCS_COP.1.1(3) The TSF shall perform [*the cryptographic operations in Table 13*] in accordance with a specified cryptographic algorithm [*in Table 13*] and cryptographic key sizes [*in Table 13*] that meet the following: [*list of standards in Table 13*].

| Operation | Algorithm | Key Size (bits) | CAVP Certificate | Standard |
|---------------------------------|--------------------|-----------------|------------------|--------------------------------------|
| Encryption and Decryption | AES CBC AES GCM | 128, 256 | A1868 | FIPS 197 SP 800-38A SP 800-38D |
| Key Agreement in support of VPN | EC DH | p-384 | A1868 | NIST SP800-56A |

| Operation | Algorithm | Key Size (bits) | CAVP Certificate | Standard |
|---|-------------------------|-----------------|------------------|---------------------------|
| Secure Hash | SHA-256 SHA-384 | Not applicable | A1868 | FIPS 180-4 |
| Keyed-Hash Message Authentication Code (HMAC) | HMAC | 256, 384 | A1868 | FIPS 198-1 |
| Asymmetric cryptography | RSA (RSASSA-PKCS1_V1_5) | 2048 | A1868 | PKCS#1 v1.5 FIPS 186-4 |

Table 13 - Cryptographic Operations (Android)

Application note: FCS_COP.1(3) applies to TOE components installed on Android 11 using the OpenSSL FIPS Object Module SE, Software Version 2.0.12. AES GCM is only used in conjunction with user authentication.

6.2.3 User Data Protection (FDP)

6.2.3.1 FDP_IFC.1 Subset information flow control

Hierarchical to: No other components.

Dependencies: FDP_IFF.1 Simple security attributes

FDP_IFC.1.1 The TSF shall enforce the [*Secure Information Flow Control SFP*] on [*Subjects: Mobility client users*]
*Information: application data*³
Operations: send, receive].

6.2.3.2 FDP_IFF.1 Simple security attributes

Hierarchical to: No other components.

Dependencies: FDP_IFC.1 Subset information flow control

FMT_MSA.3 Static attribute initialisation

FDP_IFF.1.1 The TSF shall enforce the [*Secure Information Flow Control SFP*] based on the following types of subject and information security attributes:

[*Subjects: Mobility client users*
Subject attributes: identity, authentication status
Information: application data
Information attributes: none].

³ Application data refers to the data that passes between the end user and the server when the end user accesses the application remotely.

- FDP_IFF.1.2** The TSF shall permit an information flow between a controlled subject and controlled information via a controlled operation if the following rules hold: [*The mobility client user is successfully identified and authenticated, and is an authorized user in the NetMotion Mobility implementation*].
- FDP_IFF.1.3** The TSF shall enforce the [*no additional information flow control SFP rules*].
- FDP_IFF.1.4** The TSF shall explicitly authorise an information flow based on the following rules: [*no additional rules*].
- FDP_IFF.1.5** The TSF shall explicitly deny an information flow based on the following rules: [*no additional rules*].

6.2.3.3 FDP_ITT.1 Basic internal transfer protection

- Hierarchical to: No other components.
- Dependencies: [FDP_ACC.1 Subset access control, or
FDP_IFC.1 Subset information flow control]

- FDP_ITT.1.1** The TSF shall enforce the [*Secure Information Flow Control SFP*] to prevent the [disclosure, modification] of user data when it is transmitted between physically-separated parts of the TOE.

Application Note: 'User data' refers to the application data described in FDP_IFC.1 and FDP_IFF.1.

6.2.4 Identification and Authentication (FIA)

6.2.4.1 FIA_UAU.2 User authentication before any action

- Hierarchical to: FIA_UAU.1 Timing of authentication
- Dependencies: FIA_UID.1 Timing of identification

- FIA_UAU.2.1** The TSF shall require each user to be successfully authenticated before allowing any other TSF-mediated actions on behalf of that user.

6.2.4.2 FIA_UAU.5 Multiple authentication mechanisms

- Hierarchical to: No other components.
- Dependencies: No dependencies.

- FIA_UAU.5.1** The TSF shall provide [*PEAP MS-CHAPv2, EAP-TLS*] to support user authentication.

- FIA_UAU.5.2** The TSF shall authenticate any user's claimed identity according to the [*the authentication mechanism utilized for that particular implementation*].

6.2.4.3 FIA_UID.2 User identification before any action

- Hierarchical to: FIA_UID.1 Timing of identification
- Dependencies: No dependencies.

- FIA_UID.2.1** The TSF shall require each user to be successfully identified before allowing any other TSF-mediated actions on behalf of that user.

6.2.5 Security Management (FMT)

6.2.5.1 FMT_MTD.1 Management of TSF data

Hierarchical to: No other components.
 Dependencies: FMT_SMR.1 Security roles
 FMT_SMF.1 Specification of Management Functions

FMT_MTD.1.1 The TSF shall restrict the ability to [perform the functions listed in Table 14] the [data listed in Table 14] to [Administrators].

| Data | Allowed Actions |
|--------------------------------------|---------------------------------------|
| Secure Information Flow Control Data | Change_default, query, modify, delete |
| Audit Logs | Query, clear |
| User Account Attributes | Query, modify, delete |

Table 14 - Management of TSF Data

6.2.5.2 FMT_SMF.1 Specification of Management Functions

Hierarchical to: No other components.
 Dependencies: No dependencies.

FMT_SMF.1.1 The TSF shall be capable of performing the following management functions:
 [a. Create, delete, modify, and view information flow security policy data that permits user access;
 b. Review the audit logs; and
 c. Query, modify, and delete user information].

6.2.5.3 FMT_SMR.1 Security roles

Hierarchical to: No other components.
 Dependencies: FIA_UID.1 Timing of identification

FMT_SMR.1.1 The TSF shall maintain the roles [Administrator and Mobility Client User].

FMT_SMR.1.2 The TSF shall be able to associate users with roles.

6.2.6 Protection of the TSF (FPT)

6.2.6.1 FPT_STM.1 Reliable time stamps

Hierarchical to: No other components.
 Dependencies: No dependencies.

FPT_STM.1.1 The TSF shall be able to provide reliable time stamps.

6.3 SECURITY ASSURANCE REQUIREMENTS

The assurance requirements are summarized in the following table.

| Assurance Class | Assurance Components | |
|----------------------------------|----------------------|--|
| | Identifier | Name |
| Development (ADV) | ADV_ARC.1 | Security architecture description |
| | ADV_FSP.4 | Complete functional specification |
| | ADV_IMP.1 | Implementation representation of the TSF |
| | ADV_TDS.3 | Basic modular design |
| Guidance Documents (AGD) | AGD_OPE.1 | Operational user guidance |
| | AGD_PRE.1 | Preparative procedures |
| Life-Cycle Support (ALC) | ALC_CMC.4 | Production support, acceptance procedures and automation |
| | ALC_CMS.4 | Problem tracking CM coverage |
| | ALC_DEL.1 | Delivery procedures |
| | ALC_DVS.1 | Identification of security measures |
| | ALC_FLR.2 | Flaw reporting procedures |
| | ALC_LCD.1 | Developer defined life-cycle model |
| | ALC_TAT.1 | Well-defined development tools |
| Security Target Evaluation (ASE) | ASE_CCL.1 | Conformance claims |
| | ASE_ECD.1 | Extended components definition |
| | ASE_INT.1 | ST introduction |
| | ASE_OBJ.2 | Security objectives |
| | ASE_REQ.2 | Derived security requirements |
| | ASE_SPD.1 | Security problem definition |
| | ASE_TSS.1 | TOE summary specification |
| Tests (ATE) | ATE_COV.2 | Analysis of coverage |
| | ATE_DPT.1 | Testing: basic design |
| | ATE_FUN.1 | Functional testing |
| | ATE_IND.2 | Independent testing - sample |

| Assurance Class | Assurance Components | |
|--------------------------------|----------------------|--------------------------------|
| | Identifier | Name |
| Vulnerability Assessment (AVA) | AVA_VAN.3 | Focused vulnerability analysis |

Table 15 – Security Assurance Requirements

6.4 SECURITY REQUIREMENTS RATIONALE

6.4.1 Security Functional Requirements Rationale

The following table provides a mapping between the SFRs and Security Objectives.

| | O.ACCESS | O.ACCOUNT | O.AUDIT | O.ENCRYPT | O.IDENTIFY | O.SECFUN |
|--------------|----------|-----------|---------|-----------|------------|----------|
| FAU_GEN.1 | | X | X | | | |
| FAU_SAR.1 | | | X | | | |
| FCS_CKM.1(1) | | | | X | | |
| FCS_CKM.1(2) | | | | X | | |
| FCS_CKM.1(3) | | | | X | | |
| FCS_CKM.1(4) | | | | X | | |
| FCS_CKM.4 | | | | X | | |
| FCS_COP.1(1) | | | | X | | |
| FCS_COP.1(2) | | | | X | | |
| FCS_COP.1(3) | | | | X | | |
| FDP_IFC.1 | X | | | | | |
| FDP_IFF.1 | X | | | | | |
| FDP_ITT.1 | | | | X | | |
| FIA_UAU.2 | X | | | | X | X |
| FIA_UAU.5 | | | | | X | |
| FIA_UID.2 | X | X | | | X | X |
| FMT_MTD.1 | | | | | | X |

| | O.ACCESS | O.ACCOUNT | O.AUDIT | O.ENCRYPT | O.IDENTIFY | O.SECFUN |
|-----------|----------|-----------|---------|-----------|------------|----------|
| FMT_SMF.1 | | | | | | X |
| FMT_SMR.1 | | | | | | X |
| FPT_STM.1 | | X | X | | | |

Table 16 – Mapping of SFRs to Security Objectives

6.4.2 SFR Rationale Related to Security Objectives

The following rationale traces each SFR back to the Security Objectives for the TOE.

| | | |
|--|--|---------------------------------------|
| Objective: O.ACCESS | The TOE must regulate the flow of information from users on an external network to resources on an internal network, and must ensure that rules for granting access are enforced. | |
| Security Functional Requirements: | FDP_IFC.1 | Subset information flow control |
| | FDP_IFF.1 | Simple security attributes |
| | FIA_UAU.2 | User authentication before any action |
| | FIA_UID.2 | User identification before any action |
| Rationale: | <p>FDP_IFC.1 meets this objective by identifying the Secure Information Flow Control SFP between TOE users on an external network, to the application data resources on an internal network to which the TOE controls access.</p> <p>FDP_IFF.1 builds on FDP_IFC.1 by identifying the user attributes and the secure information flow control rules. It meets the O.ACCESS objective by enforcing the rules for the information flow between TOE users on an external network, to the TOE controlled resources on an internal network.</p> <p>FIA_UAU.2 supports this objective by ensuring that the user information required to enforce the Secure Information Flow Control SFP is available.</p> <p>FIA_UID.2 supports this objective by ensuring that the user information required to enforce the Secure Information Flow Control SFP is available.</p> | |

| | | |
|--|---|---------------------------------------|
| Objective: O.ACCOUNT | Users must be accountable for their use of the TOE and authorized administrators must be accountable for their use of TOE security management functions. | |
| Security Functional Requirements: | FAU_GEN.1 | Audit data generation |
| | FIA_UID.2 | User identification before any action |
| | FPT_STM.1 | Reliable time stamps |
| Rationale: | <p>FAU_GEN.1 meets objective by ensuring that audit records are produced with sufficient detail to hold users accountable for their actions related to the use of the TOE, including use of the TOE security management functions.</p> <p>FIA_UID.2 supports this objective by identifying users so they may be held accountable for their use of the TOE.</p> <p>FPT_STM.1 supports this objective by ensuring that audit records are produced with a reliable time stamp to hold users accountable for their actions related to the use of the TOE, including the use of the TOE security management functions.</p> | |

| | | |
|--|---|-----------------------|
| Objective: O.AUDIT | The TOE must record security relevant events, the date and time the events occurred, and provide a means to read this information. | |
| Security Functional Requirements: | FAU_GEN.1 | Audit data generation |
| | FAU_SAR.1 | Audit review |
| | FPT_STM.1 | Reliable time stamps |
| Rationale: | <p>FAU_GEN.1 meets this objective by ensuring that security relevant events are recorded.</p> <p>FAU_SAR.1 meets this objective by providing a means to read the records for security relevant events.</p> <p>FPT_STM.1 supports this objective by providing a time stamp for all auditable events.</p> | |

| | | |
|--|--|-------------------------------------|
| Objective: O.ENCRYPT | The TOE must protect the confidentiality and integrity of information that flows between distributed TOE components. | |
| Security Functional Requirements: | FCS_CKM.1(1) | Cryptographic key generation (AES) |
| | FCS_CKM.1(2) | Cryptographic key generation (RSA) |
| | FCS_CKM.1(3) | Cryptographic key generation (ECDH) |
| | FCS_CKM.1(4) | Cryptographic key generation (DH) |

| | | |
|-------------------|---|---|
| | FCS_CKM.4 | Cryptographic key destruction |
| | FCS_COP.1(1) | Cryptographic operation (Windows) |
| | FCS_COP.1(2) | Cryptographic operation (iOS and macOS) |
| | FCS_COP.1(3) | Cryptographic operation (Android) |
| | FDP_ITT.1 | Basic internal transfer protection |
| Rationale: | <p>The FCS_CKM.1 claims support this objective by ensuring that cryptographic keys are appropriately generated to support the use of the encryption that provides confidentiality and integrity of the information that flows between distributed TOE components, and between the TOE and authentication services in the operational environment.</p> <p>FCS_CKM.4 supports this objective by ensuring that encryption keys are properly destroyed, mitigating the risk of improper use, and thereby supporting the confidentiality and integrity of the information that flows between distributed TOE components, and between the TOE and authentication services in the operational environment.</p> <p>The FCS_COP.1 claims support this objective by providing the encryption services that ensure the confidentiality and integrity of the information that flows between distributed TOE components, and between the TOE and authentication services in the operational environment.</p> <p>FDP_ITT.1 supports this objective by ensuring that the confidentiality and integrity of data is preserved as it passes between parts of the TOE.</p> | |

| | | |
|--|--|---------------------------------------|
| Objective: O.IDENTIFY | The TOE must ensure that users are identified and authenticated using an approved authentication mechanism prior to allowing access to TOE functions and data. | |
| Security Functional Requirements: | FIA_UAU.2 | User authentication before any action |
| | FIA_UAU.5 | Multiple authentication mechanisms |
| | FIA_UID.2 | User identification before any action |
| Rationale: | <p>FIA_UAU.2 meets this objective by ensuring that users are authenticated prior to being allowed access to TOE functions and data.</p> <p>FIA_UAU.5 meets this objective by ensuring that users are authenticated using an approved authentication mechanism before being granted access to TOE functions or data.</p> <p>FIA_UID.2 meets this objective by ensuring that users are identified prior to being allowed access to TOE functions and data.</p> | |

| | | |
|--|---|---------------------------------------|
| Objective: O.SECFUN | The TOE must provide functionality that enables authorized administrators authenticated in the operational environment to manage the security functions of the TOE, and must ensure that only authorized administrators are able to access this functionality. | |
| Security Functional Requirements: | FIA_UAU.2 | User authentication before any action |
| | FIA_UID.2 | User identification before any action |
| | FMT_MTD.1 | Management of TSF data |
| | FMT_SMF.1 | Specification of management functions |
| | FMT_SMR.1 | Security roles |
| Rationale: | <p>FIA_UAU.2 meets this objective by ensuring that only authorized administrators may access security management functionality.</p> <p>FIA_UID.2 meets this objective by ensuring that only authorized administrators may access security management functionality.</p> <p>FMT_MTD.1 meets this objective by ensuring that only authorized administrators have access to security management functions.</p> <p>FMT_SMF.1 meets this objective by providing the functionality that enables authorized administrators to manage the security functions of the TOE.</p> <p>FMT_SMR.1 meets this objective by providing the roles that are used to ensure that only authorized administrators are able to access security management functions.</p> | |

6.4.3 Dependency Rationale

Table 17 identifies the Security Functional Requirements from Part 2 of the CC and their associated dependencies. It also indicates whether the ST explicitly addresses each dependency.

| SFR | Dependency | Dependency Satisfied | Rationale |
|--------------|------------------------|----------------------|---|
| FAU_GEN.1 | FPT_STM.1 | ✓ | |
| FAU_SAR.1 | FAU_GEN.1 | ✓ | |
| FCS_CKM.1(1) | FCS_CKM.2 or FCS_COP.1 | ✓ | Satisfied by FCS_COP.1(1), FCS_COP.1(2), and FCS_COP.1(3) |
| | FCS_CKM.4 | ✓ | |

| SFR | Dependency | Dependency Satisfied | Rationale |
|--------------|-------------------------------------|----------------------|---|
| FCS_CKM.1(2) | FCS_CKM.2 or FCS_COP.1 | ✓ | Satisfied by FCS_COP.1(1), FCS_COP.1(2), and FCS_COP.1(3) |
| | FCS_CKM.4 | ✓ | |
| FCS_CKM.1(3) | FCS_CKM.2 or FCS_COP.1 | ✓ | Satisfied by FCS_COP.1(1), FCS_COP.1(2), and FCS_COP.1(3) |
| | FCS_CKM.4 | ✓ | |
| FCS_CKM.1(4) | FCS_CKM.2 or FCS_COP.1 | ✓ | Satisfied by FCS_COP.1(1), FCS_COP.1(2), and FCS_COP.1(3) |
| | FCS_CKM.4 | ✓ | |
| FCS_CKM.4 | FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1 | ✓ | Satisfied by FCS_CKM.1(1), FCS_CKM.1(2), FCS_CKM.1(3), and FCS_CKM.1(4) |
| FCS_COP.1(1) | FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1 | ✓ | Satisfied by FCS_CKM.1(1), FCS_CKM.1(2), and FCS_CKM.1(3) |
| | FCS_CKM.4 | ✓ | |
| FCS_COP.1(2) | FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1 | ✓ | Satisfied by FCS_CKM.1(1), FCS_CKM.1(2), and FCS_CKM.1(3) |
| | FCS_CKM.4 | ✓ | |
| FCS_COP.1(3) | FDP_ITC.1 or FDP_ITC.2 or FCS_CKM.1 | ✓ | Satisfied by FCS_CKM.1(1), FCS_CKM.1(2), and FCS_CKM.1(3) |
| | FCS_CKM.4 | ✓ | |
| FDP_IFC.1 | FDP_IFF.1 | ✓ | |

| SFR | Dependency | Dependency Satisfied | Rationale |
|-----------|------------------------|----------------------|---|
| FDP_IFF.1 | FDP_IFC.1 | ✓ | |
| | FMT_MSA.3 | ✓ | FMT_MSA.3 is not included because there are no configurable security attributes associated with the Secure Information Flow Control SFP, and therefore, no default values provided by the TOE. The security attributes for the Secure Information Flow Control SFP are Mobility client user identity, which is provided by the user, and authentication status, which is provided by the authentication server. |
| FDP_ITT.1 | FDP_ACC.1 or FDP_IFC.1 | ✓ | Satisfied by FDP_IFC.1 |
| FIA_UAU.2 | FIA_UID.1 | ✓ | FIA_UID.2 is hierarchical to FIA_UID.1; this dependency has been satisfied. |
| FIA_UAU.5 | None | N/A | |
| FIA_UID.2 | None | N/A | |
| FMT_MTD.1 | FMT_SMR.1 | ✓ | |
| | FMT_SMF.1 | ✓ | |
| FMT_SMF.1 | None | N/A | |
| FMT_SMR.1 | FIA_UID.1 | ✓ | FIA_UID.2 is hierarchical to FIA_UID.1; this dependency has been satisfied. |
| FPT_STM.1 | None | N/A | |

Table 17 – Functional Requirement Dependencies

6.4.4 Security Assurance Requirements Rationale

The TOE assurance requirements for this ST consist of the requirements corresponding to the EAL 4 level of assurance, as defined in the CC Part 3, augmented by the inclusion of Flaw reporting procedures (ALC_FLR.2). EAL 4 was chosen because it is based upon good commercial development practices with thorough functional testing. EAL 4 provides customers with a moderate level of independently assured security in a conventional commercial TOE. The

threat of malicious attacks is not greater than low, the security environment provides physical protection, and the TOE itself offers a very limited, purpose-built interface. The developer is claiming the ALC_FLR.2 augmentation since there are a number of areas where current practices and procedures exceed the minimum requirements for EAL 4.

7 TOE SUMMARY SPECIFICATION

This section provides a description of the security functions and assurance measures of the TOE that meet the TOE security requirements.

7.1 SECURITY AUDIT

The activity log records connection events. The log file is written in a comma-delimited format (CSV). The activity log records the following information.

| Event | Event Description | Audit Record |
|-------------|--|--|
| Connect | The Mobility client connects to the Mobility server | <ul style="list-style-type: none"> • Date and time the connection was made • Device Name • User Name • Virtual IP assigned by the Mobility server • Point of Presence (PoP) address of the Mobility client device at its current location • The number of bytes sent and received during the connection period |
| Disconnect | The Mobility client was disconnected from the Mobility server. | <ul style="list-style-type: none"> • Date/Time • Device Name • User Name • Reason for disconnect |
| Unreachable | <p>The Mobility server could not reach a client device that was connected to the server. An unreachable state occurs when the following occurs:</p> <ul style="list-style-type: none"> • A client's network connection fails • The device leaves the area network and no other network is available • The device goes into standby or hibernation. • The server receives no confirmation from the client device that it must disconnect from the server. | <ul style="list-style-type: none"> • Date and time the client was unavailable • Device Name • User Name |

| Event | Event Description | Audit Record |
|-----------|---|---|
| Reachable | The Mobility client that was unreachable has reconnected. | <ul style="list-style-type: none"> • Date and time when the connection was re-established • Device Name • User Name |
| Roaming | A Mobility client moved to a different network or the network connection changed. | <ul style="list-style-type: none"> • Date and time of when the connection change was made • Device Name • User Name • Virtual IP assigned by the Mobility server • PoP address of the Mobility client device at its current location • The number of bytes sent and received during the connection period |

Table 18 - Activity Log Information

The activity log page displays the connection events, and automatically refreshes the display as it records new events.

The event log collects information on events that occur on the server, including:

- All decisions on requests for information flow
- When an encrypted session is established
- Startup and shutdown of audit function (as indicated by startup/shutdown of TOE)
- Administrator logon

The event log is a binary file updated by Mobility components. By default, Mobility events are logged to `nmevent.nel` in the Windows folder. They may be viewed using the Mobility Console. The event log records the following information.

| Event | Description |
|-----------|--|
| Type | The message types include Trace, Debug, Information, Warning and Error. An administrator may specify which event types are logged. |
| Date/Time | This is the date and time of the event. |
| Source | This is the module that produced the event. |
| Data | This is the event log message. |

Table 19 - Event Log Information

TOE Security Functional Requirements addressed: FAU_GEN.1, FAU_SAR.1.

7.2 CRYPTOGRAPHIC SUPPORT

Mobility encrypts data transmitted between the Mobility server and the Mobility client using FIPS-validated cryptographic algorithms. The cryptographic algorithms and corresponding Cryptographic Algorithm Validation Program (CAVP) certificates are identified in Table 11 (Windows), Table 12 (iOS and macOS) and Table 13 (Android).

The Microsoft and Apple cryptographic modules pre-exist in their respective operating systems. Since no suitable cryptographic module exists in the Android operating system, the OpenSSL FIPS Object Module software is delivered to the device with the NetMotion client software.

For the Mobility Server, keys are created by the cryptographic module in the Windows Server 2019 operating system, in accordance with the security policy. Likewise, for Mobility Client on Windows, the keys are created by the cryptographic module in the Windows 10 operating system, in accordance with the security policies. Windows uses a NIST SP800-90A DRBG (CTR_DRBG) for symmetric and asymmetric keys in the CNG.SYS library.

For Mobility Client on iOS, the keys are created by the cryptographic module in the iOS operating system, in accordance with the security policy. iOS uses a NIST SP800-90A DRBG (CTR_DRBG) for symmetric and asymmetric key generation.

For Mobility Client on macOS, the keys are created by the cryptographic module in the macOS operating system, in accordance with the security policy. MacOS uses a NIST SP800-90A DRBG (CTR_DRBG) for symmetric and asymmetric key generation.

For Mobility Client on Android, symmetric keys are generated using a Counter Mode Deterministic Random Bit Generator (CTR_DRBG) (using AES) in the OpenSSL library. This DRBG has been validated in accordance with NIST Special Publication 800-90, Recommendation for Random Number generation Using Deterministic Random Bit Generators. Asymmetric keys are generated in accordance with FIPS 186-4.

Elliptic Curve Diffie-Hellman (ECDH) using NIST approved curves is used for key agreement operations in support of the establishment of a VPN tunnel. Each party generates an ephemeral key pair. Diffie-Hellman Key Agreement (DH) is used by each of the mobile devices in support of PEAP MS-CHAPv2 authentication. DH is implemented in accordance with NIST SP-800-56A for Finite Field Cryptography (FFC), and provides 112 or 128 bits of security strength.

For all of the operating systems, the keys are zeroized by the cryptographic module in accordance with FIPS 140-2 zeroization standards. Calls are made by the Mobility component to the cryptographic module in support of all cryptographic operations. All cryptographic operations are completed using CAVP validated algorithms.

The Mobility server determines the algorithm used to encrypt client connections. In the evaluated configuration, only FIPS 140-2 validated cryptographic modules

are permitted. The client cannot negotiate a lower encryption level. If a client does not support the encryption method set on the server, it cannot connect and posts a message in the client event log.

If a client accepts the requested encryption method, but then tries to establish an unencrypted connection or a connection using a different encryption method, the Mobility server disconnects the session and posts a warning in the server event log.

7.2.1 Use of Cryptographic Primitives

The following table identifies the usage of the claimed cryptographic primitives.

| Function | Supporting Algorithms |
|-------------------------------|--|
| PEAP MS-CHAPv2 Authentication | Diffie Hellman Key Agreement and ECDH P-384, P-256 |
| | RSA |
| | AES CBC 128, 256; AES GCM 128, 256 |
| | SHA-256, SHA 384 |
| EAP-TLS | ECDH P-384, P-256 |
| | AES CBC 128, 256; AES GCM 128, 256 |
| | RSA |
| | SHA-256, SHA-384 |
| | HMAC 256, HMAC 384 |
| Encrypted Tunnel | ECDH P-384, P-521 |
| | AES CBC 128, 256 |
| | SHA-256, SHA-384 |
| | HMAC 256, HMAC 384 |

Table 20 - Cryptographic Primitives Usage

The National Institute of Standards and Technology (NIST) curve P-256 is used for authentication by Windows, iOS and macOS clients. P-521 is used to establish the Mobility encrypted tunnel for the Windows client, and P-384 is used by the iOS and macOS clients. The Android client uses P-384.

TOE Security Functional Requirements addressed: FCS_CKM.1(1), FCS_CKM.1(2), FCS_CKM.1(3), FCS_CKM.1(4), FCS_CKM.4, FCS_COP.1(1), FCS_COP.1(2), FCS_COP.1(3).

7.3 USER DATA PROTECTION

The TOE enforces the Secure Information Flow Control SFP between the Mobility Server and the Mobility Client by means of end-user authentication. For the purposes of the evaluation, the TOE uses a RADIUS (RFC 2865) based authentication server and a standards compliant implementation of the PEAP MS-CHAPv2 or EAP-TLS.

When the Mobility Server is configured to use RADIUS for authentication, it acts as a Network Access Server (NAS) in the RADIUS security system. Authentication is performed using a database that supports the PEAP MS-CHAPv2 format, such as Microsoft Active Directory (AD) (PEAPv0, draft-josefsson-pppext-eap-tls-eap-06).

Although standards compliance is claimed, modern RADIUS authenticators do not enforce use of the mandatory ciphersuite in PEAP. Cisco RADIUS servers disable RC4 by default and Microsoft allows use of RC4 to be disabled. In the evaluated configuration, use of RC4 and MD5 must be disabled. However, it should be noted that even without this configuration, Mobility will default to PEAP authentication using a ciphersuite with RSA, AES 256 and SHA 384.

7.3.1 PEAP MS-CHAPv2 Authentication

Protected Extensible Authentication Protocol (PEAP) is used in the evaluated configuration in support of user login. PEAP encapsulates the Extensible Authentication Protocol (EAP) within an encrypted and authenticated Transport Layer Security (TLS) tunnel. The inner authentication protocol is Microsoft's Challenge Handshake Authentication Protocol Version 2 (RFC 2759).

The encrypted tunnel is set up as follows:

Step 1 – PEAP Stage 1

The client contacts the Mobility Server. The authentication server presents its certificate. The client verifies that the certificate is valid, was signed by a Certification Authority (CA) trusted by the client, and was issued to a known server. The client and authentication server continue to establish a TLS tunnel, using a crypto suite that is supported by both the client and the authentication server. This step uses Diffie-Hellman (DH) key agreement to set up the outer tunnel.

Step 2 – PEAP Stage 2

A PEAP MS-CHAPv2 exchange occurs within the tunnel to authenticate the user using a challenge response (this exchange is described in RFC 2759). The user is authenticated to the authentication server.

Step 3 – Elliptic Curve Diffie-Hellman (ECDH)

ECDH key agreement occurs between the Mobility client and the Mobility server to create the symmetric keys that will be used to encrypt the session. This exchange is authenticated using HMAC-MD5 and the key generated during the PEAP MS-CHAPv2 exchange (RFC 2548 paragraph 2.4.1).

Step 4 – Encrypted tunnel

Data passes between the client and the application server, through the Mobility server. The data is encrypted with the symmetric keys between the client and the mobility server.

7.3.2 EAP-TLS Authentication

The other user authentication option is Extensible Authentication Protocol Transport Layer Security (EAP-TLS) (RFC 5216). This is very similar to the PEAP implementation, except that user certificates are presented instead of a username and password.

The encrypted tunnel is set up as follows:

Step 1 – EAP Stage 1

The client contacts the authentication server. The authentication server presents its certificate. The client verifies that the certificate is valid, was signed by a Certification Authority (CA) trusted by the client, and was issued to a known server.

Step 2 – EAP Stage 2

The user presents a user certificate which may be verified by the authentication server. The user certificate may be installed on a smart card, or in the user's personal certificate store. A password may be required to access the user certificate.

Step 3 – Elliptic Curve Diffie-Hellman (ECDH)

ECDH key agreement occurs between the Mobility client and the Mobility server to create the symmetric keys that will be used to encrypt the session. This exchange is authenticated using HMAC-MD5 and the key generated during the EAP-TLS exchange (RFC 5216 paragraph 2.3 Master Session Key (MSK)).

Step 4 – Encrypted tunnel

Data passes between the client and the application server, through the Mobility server. The data is encrypted with the symmetric keys between the client and the mobility server.

Once the Authentication server confirms that the user is identified and authenticated, the Mobility Server allows data to flow from the Mobility Client, through the Mobility Server to the protected internal resource. The Mobility client secures all the application data destined for the TCP/IP network stack, including TCP, UDP and ICMP ping using a VPN tunnel between the Mobility client and the Mobility server. This ensures that the confidentiality and integrity of any data is protected using FIPS-140-2 validated cryptographic modules.

Local traffic such as loopback traffic and data destined for local applications is not sent through the encrypted tunnel.

TOE Security Functional Requirements addressed: FDP_IFC.1, FDP_IFF.1, FDP_ITT.1.

7.4 IDENTIFICATION AND AUTHENTICATION

Users of the Mobility Console must provide Windows credentials that are valid for an account on the Mobility server operating system or in the domain in which the server participates. The Mobility Console user enters a username and password, which are verified in the operating system. The user is only granted access to the Mobility Console if the username and password are correct, and the user is a member of a group which has a Mobility Console role.

Users of the Mobility Client must be identified and authenticated before being allowed access to protected resources, as described in Section 0. The authentication mechanism may be either PEAP MS-CHAPv2 or EAP-TLS. Users will authenticate using the mechanism that has been implemented in their environment.

Administrators authenticate to the Mobility Server from the management console computer. Both the authentication server and the management console computer are located on a trusted internal network.

TOE Security Functional Requirements addressed: FIA_UAU.2, FIA_UAU.5, FIA_UID.2.

7.5 SECURITY MANAGEMENT

The Mobility Console provides the functionality to manage NetMotion Mobility. This functionality includes:

- Creating, deleting, modifying and viewing the information flow security policy rules that permit or deny information flows, and changing default values for, querying, modifying and deleting the data required to establish those rules;
- Reviewing and clearing audit logs; and
- Querying, modifying and deleting user account attributes.

Users of the Mobility Console must be a member of the Administrator group or be made an administrator on the Mobility Console. The Mobility server is installed with the built-in Administrator role, which is assigned to the Administrators group in Active Directory. To access the Mobility Console, users must provide Windows credentials that are valid for an account on the Mobility server or in the domain in which the server participates.

Mobility Client Users do not have access to Mobility Console functions.

TOE Security Functional Requirements addressed: FMT_MTD.1, FMT_SMF.1, FMT_SMR.1.

7.6 PROTECTION OF THE TSF

All events on the Mobility server are logged and stamped with the date and time, which is retrieved from the operating system. All log timestamps are written as `yyyyMMdd` and `hh:mm:ss`.

Both IPv4 and IPv6 addressing are supported.

TOE Security Functional Requirements addressed: FPT_STM.1.

8 TERMINOLOGY AND ACRONYMS

8.1 TERMINOLOGY

The following terminology is used in this ST:

| Term | Description |
|-----------------------------|--|
| Activity log | The activity log records connection events and is written in a comma-delimited format for export and analysis. To view the activity log, the administrator opens the Mobility Console and selects the 'Activity log' link at the top of the page. |
| Application data | Application data refers to the data that passes between the end user and the server when the end user accesses the application remotely. The application may be any client/server application written for an IP network. Application data includes, but is not limited to, documents, spreadsheets, images, and XML data. Application data is considered to be at risk when it is transmitted on an external public network. |
| Event log | The event log is a binary file updated by any Mobility component that logs event messages. By default, events are logged to nmevent.nel in the Windows folder. To view the event log, the administrator opens the Mobility Console and selects the 'Event log' link at the top of the page. |
| Management Console Computer | This is the hardware that supports use of the Mobility Console through a browser. It is not part of the TOE. |
| Mobility Console | The Mobility Console is a web-based configuration and management utility that an administrator can use to configure settings, create and apply client policies, monitor server status and client connections, monitor activity or event logs, and troubleshoot problems. It is part of the TOE. |

Table 21 – Terminology

8.2 ACRONYMS

The following acronyms are used in this ST:

| Acronym | Definition |
|---------|--|
| AD | Active Directory |
| AES | Advanced Encryption Standard |
| API | Application Programming Interface |
| CA | Certification Authority |
| CAVP | Cryptographic Algorithm Validation Program |

| Acronym | Definition |
|----------|---|
| CBC | Cipher Block Chaining |
| CC | Common Criteria |
| CSEC | Swedish Certification Body for IT Security |
| CSV | Comma separated values |
| CTR-DRBG | Counter mode Deterministic Random Bit Generator |
| DH | Diffie-Hellman |
| DRBG | Deterministic Random Bit Generator |
| EAL | Evaluation Assurance Level |
| EAP | Extensible Authentication Protocol |
| ECDH | Elliptic Curve Diffie-Hellman |
| FFC | Finite Field Cryptography |
| FIPS | Federal Information Processing Standards |
| GB | Gigabyte |
| GCM | Galois/Counter Mode |
| HMAC | Hash Message Authentication Code |
| HTTPS | Hypertext transfer protocol secure |
| ICMP | Internet Control Message Protocol |
| IP | Internet Protocol |
| IT | Information Technology |
| LAN | Local Area Network |
| MS-CHAP | Microsoft Challenge-Handshake Authentication Protocol |
| MSK | Master Session Key |
| NAS | Network Access Server |
| NIST | National Institute of Standards and Technology (USA) |
| NTLM | NT LAN Manager (Windows Challenge/Response authentication protocol) |
| PEAP | Protected Extensible Authentication Protocol |
| PKCS1 | Public-Key Cryptography Standard #1 for RSA key pairs |
| PKI | Public Key Infrastructure |

| Acronym | Definition |
|---------|---|
| PoP | Point of Presence |
| PP | Protection Profile |
| RADIUS | Remote Authentication Dial In User Service |
| RAM | Random Access Memory |
| RBG | Random Bit Generator |
| RSASSA | RSA Signature Scheme with Appendix |
| SFP | Security Function Policy |
| SFR | Security Functional Requirement |
| SHA | Secure Hash Algorithm |
| ST | Security Target |
| TCP/IP | Transmission Control Protocol / Internet Protocol |
| TLS | Transport Layer Security |
| TOE | Target of Evaluation |
| TSF | TOE Security Functionality |
| UDP | User Datagram Protocol |
| USA | United States of America |
| VPN | Virtual Private Network |
