# 1 Security Target Introduction

This chapter presents the Security Target (ST) identification information and an overview. An ST contains the Information Technology (IT) security requirements of an identified Target of Evaluation (TOE) and specifies the functional and assurance security measures offered by the TOE.

#### 1.1 ST Reference

This section provides information needed to identify and control this ST and its Target of Evaluation.

#### 1.1.1 **ST Identification**

ST Title: VMware Workspace ONE Boxer Email Client Version 23.11 Security Target

ST Version: 1.0

ST Publication Date: March 4, 2024

**ST Author:** Booz Allen Hamilton

#### 1.1.2 **Document Organization**

*Chapter 1* of this document provides identifying information for the ST and TOE as well as a brief description of the TOE and its associated TOE type.

*Chapter 2* describes the TOE in terms of its physical boundary, logical boundary, exclusions, and dependent Operational Environment components.

Chapter 3 describes the conformance claims made by this ST.

*Chapter 4* describes the threats, assumptions, objectives, and organizational security policies that apply to the TOE.

*Chapter 5* defines extended Security Functional Requirements (SFRs) and Security Assurance Requirements (SARs).

Chapter 6 describes the SFRs that are to be implemented by the TSF.

*Chapter* 7 describes the SARs that will be used to evaluate the TOE.

*Chapter 8* provides the TOE Summary Specification, which describes how the SFRs that are defined for the TOE are implemented by the TSF.

#### 1.1.3 **Terminology**

This section defines the terminology used throughout this ST. The terminology used throughout this ST is defined in Table 1 and 2. These tables are to be used by the reader as a quick reference guide for terminology definitions.

Term	Definition
Administrator	An individual that has the ability to manage some aspect of mobile device
	configuration using the VMware Workspace ONE Unified Endpoint Management
	(UEM) console. UEM is a Mobile Device Management (MDM) product that contains a
	server and an agent that resides on the mobile device.

Term	Definition
Managed Device	Managed devices are those devices that are enrolled and managed by an MDM product.
	Enrolled devices have an agent installed on the device which provide status and policy
	information about the device to the UEM. Additionally, the agent is responsible for
	retrieving configuration information for the managed applications installed on the
	device.
End User	An individual who possesses a mobile device with the VMware Workspace ONE Boxer
	Email Client application installed and enrolled into UEM.

**Table 1: Customer Specific Terminology** 

Term	Definition	
Authorized	The claimed Protection Profile defines an Authorized Administrator role that is	
Administrator	authorized to manage the TOE and its data.	
Security	Synonymous with Authorized Administrator.	
Administrator	Synonymous with Authorized Authinistrator.	
Trusted Channel	An encrypted connection between the TOE and a system in the Operational	
Trusteu Chamiei	Environment.	
Trusted Path	An encrypted connection between the TOE and the application an Authorized	
Trusteu ratii	Administrator uses to manage it (web browser, terminal client, etc.).	
User In a CC context, any individual who has the ability to manage TOE functions		

Table 2: CC Specific Terminology

# 1.1.4 Acronyms

The acronyms used throughout this ST are defined in Table 3. This table is to be used by the reader as a quick reference guide for acronym definitions.

Acronym	Definition
CA	Certificate Authority
CC	Common Criteria
HTTP	Hypertext Transfer Protocol
HTTPS	Hypertext Transfer Protocol Secure over a bidirectional TLS encrypted tunnel
IT	Information Technology
MDM	Mobile Device Management
NIAP	National Information Assurance Partnership
OCSP Online Certificate Status Protocol	
OS	Operating System
PP	Protection Profile
SAR	Security Assurance Requirement
SFR	Security Functional Requirement
SSL	Secure Sockets Layer
ST	Security Target
TLS Transport Layer Security	
TOE Target of Evaluation	
TSF TOE Security Function	
UEM	Unified Endpoint Management

**Table 3: Acronym Definition**

#### 1.2 TOE Reference

The TOE is the VMware Workspace ONE Boxer Email Client Version 23.11.

#### 1.3 TOE Overview

The TOE is the VMware Workspace ONE Boxer Email Client product referred to as Boxer or TOE from this point forward. Boxer is an email client application software product that is installed on a mobile

device platform. The Boxer application containerizes enterprise data from personal data that resides on the user's mobile device. Boxer supports the use of Microsoft Exchange (using ActiveSync and/or Exchange Web Services), Office 365, Outlook, Gmail, Yahoo, Google Workspace and Lotus Notes, and Cloud email services. For the evaluated configuration, the enterprise management email support only applies to the use of Microsoft Exchange.

In the evaluated configuration, the TOE is installed on a mobile device running iOS 16 (VID11349), a mobile device running iPadOS 16 (VID11350), as well as a mobile device host running Android 13 (VID11342). The mobile devices must be enrolled and managed by the VMware Workspace ONE Unified Endpoint Management (UEM) at the device level. When the TOE application is installed on the mobile device it is then enrolled as a managed application in UEM in order to obtain its configuration information.

Additionally, the TOE is configured to use ActiveSync to communicate with the Microsoft Exchange server over a TLS v1.2 trusted channel. The Exchange server resides in the operational environment and is for sending and receiving enterprise data such as email, calendar information and appointment data. Whether installed on an Android or iOS/iPadOS device, the application validates the certificates using OCSP. The OCSP responder is also considered part of the operational environment.

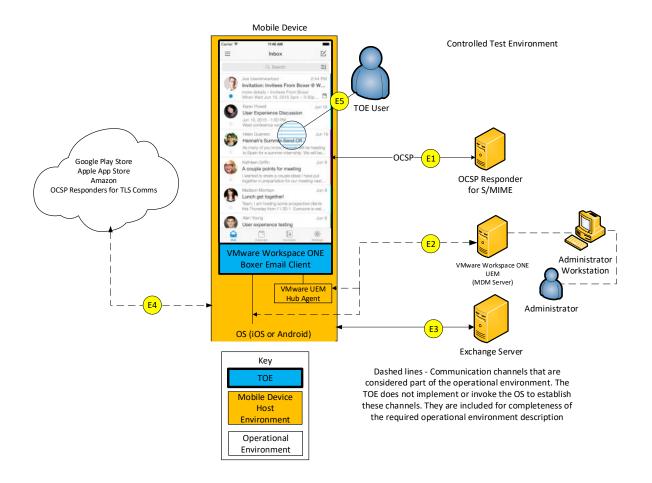

Figure 1: TOE Boundary

As depicted in Figure 1, the TOE resides on the mobile device host running iOS 16, iPadOS 16 or Android 13.

- E1: TOE to OCSP Responder This interface is used for certificate validation checking over HTTP using the OCSP protocol.
- E2: VMware Workspace ONE Intelligent Hub/OS to TOE This interface is used for communication between the TOE and the device MDM agent for downloading policy information received from the VMware Workspace ONE Unified Endpoint Management (UEM/MDM server).
- E3: Mobile device OS platform to Exchange server This interface is used for communication between the mobile device OS platform and the remote Exchange server for sending and receiving email, when invoked by the TOE. All data is encrypted using TLS.
- E4: TOE to/from mobile device OS platform store This interface is used for communicating data between the TOE and the underlying mobile device OS platform application store when it is invoked.
- E5: User to TOE This interface is used for users who wish to interact with the TOE for checking e-mail, sending e-mail, and other TOE provided functionality.

# 1.4 TOE Type

TOE type is Application Software Email Client.

The TOE is application software that is installed on mobile devices which provides email client services that allows the user to receive, send, manage, and access enterprise email on their mobile device.

# 2 TOE Description

This section provides a description of the TOE in its evaluated configuration. This includes the physical and logical boundaries of the TOE.

## 2.1 Evaluated Components of the TOE

The following table describes the TOE components in the evaluated configuration:

Component	Definition	
VMware Workspace ONE		
Boxer Email Client v 23.11	VMware Email Client Application	
Application for Apple iOS 16*		
VMware Workspace ONE		
Boxer Email Client v 23.11	VMware Email Client Application	
Application for Apple iPadOS		
16*		
VMware Workspace ONE		
Boxer Email Client v 23.11	VMware Email Client Application	
Application for Android 13*		

**Table 4: Evaluated Components of the TOE** 

As shown in Figure 1, the TOE boundary on the end user mobile devices includes only the Boxer application. The mobile device and the OS that the application is installed on are considered part of the operational environment. The devices and the OS have been evaluated against the Mobile Device Fundamentals Protection Profile under the Validation ID numbers identified in Table 4 above.

# 2.2 Components and Applications in the Operational Environment

The following table lists components and applications in the environment that the TOE relies upon in order to function properly:

Component	Definition	
OCSP Responder	A server deployed within the Operational Environment which confirms the validity	
OCSI Kesponder	and revocation status of certificates.	
VMware Workspace	The VMware Workspace ONE UEM server is used to manage the Boxer app (TOE)	
ONE Unified Endpoint	and its host mobile device. The UEM Server provides administrative access through	
Management (UEM)	its UEM Console.	
Server		
Microsoft Exchange	Exchange server for sending and receiving emails to and from the Operational	
Server 2019	Environment configured to use ActiveSync to communicate.	
	The hardware that runs the OS in which the application is installed on.	
Mobile Device	The TOE was installed on a certified iOS 16 (VID11349) device, iPadOS 16	
Mobile Device	(VID11350), and certified Android 13 (VID11342) device. For testing, this	
	evaluation used a Samsung Galaxy XCover6 Pro (Android), iPad Air 4 <sup>th</sup> generation	
	(Apple), and an iPhone 12 Pro (Apple).	

**Table 5: Components of the Operational Environment** 

<sup>\*</sup>certified iOS 16 (VID11349), certified iPadOS 16 (VID11350), and certified Android 13 (VID11342).

#### 2.3 Excluded from the TOE

The following optional products, components, and/or applications can be integrated with the TOE but are not included in the evaluated configuration. They provide no added security related functionality for the evaluated product. They are separated into three categories: not installed, installed but requires a separate license, and installed but not part of the TSF.

#### 2.3.1 **Not Installed**

There are no components that are not installed.

#### 2.3.2 Installed but Requires a Separate License

There are no excluded components that are installed and require a separate license.

#### 2.3.3 Installed but Not Part of the TSF

This section contains functionality or components that are part of the purchased product but are not part of the TSF relevant functionality that is being evaluated as the TOE.

There are no discrete individual components that are excluded from the TSF. Note however that the logical boundary of the TOE only includes the functionality that satisfies the Security Functional Requirements in the claimed Protection Profiles and the configuration specified in Section 2 above. Therefore, Boxer support for Microsoft Exchange (using Exchange Web Services), Office 365, Outlook, Gmail, Yahoo, Google Workspace, Lotus Notes, and Cloud email services are not part of the evaluated configuration.

If the product provides functionality that is not used to satisfy any of the PP defined requirements, it is considered to be security-non-interfering functionality and is not part of the evaluated configuration.

# 2.4 Physical Boundary

#### 2.4.1 Hardware

This is a software-only TOE. All hardware that is present is part of the TOE's Operational Environment.

VMware Workspace ONE Boxer Email Client v 23.11 Application for Apple iOS 16

iPhone 12 Pro, Apple A14 Bionic, certified iOS 16 VID11349

VMware Workspace ONE Boxer Email Client v 23.11 Application for Apple iPadOS 16

iPad Air 4<sup>th</sup> generation, Apple A14 Bionic, certified iPadOS 16 VID11350

VMware Workspace ONE Boxer Email Client v 23.11 Application for Android 13

Samsung Galaxy XCover6 Pro, Qualcomm Snapdragon 778G SM7325, certified Android 13 VID11342

#### 2.4.2 **Software**

The physical boundary of the TOE software is the Boxer application and its configuration data.

# 2.5 Logical Boundary

The TOE is comprised of several security features. Each of these security features consists of several security functionalities, as identified below. This ST includes the security functional requirements from the Application Software Protection Profile v1.4 and the Email Client Extended Package v2.0. The security requirements that are derived from the Application Software Protection Profile are denoted with [APP\_PP] and the requirements that are derived from the Application Software Extended Package for Email Clients are denoted with [EC\_EP].

- 1. Cryptographic Support
- 2. User Data Protection
- 3. Identification and Authentication
- 4. Security Management
- 5. Privacy
- 6. Protection of the TSF
- 7. Trusted Path/Channels

#### 2.5.1 **Cryptographic Support**

OpenSSL Algorithm for S/MIME (CAVP Cert# A5073)	SFR	Standard

FCS COP.1/SKC	TILD 230 CIR	11151 51 000-30A
FCS_COP.1/SKC		

Table 6: Boxer's OpenSSL Implementation on Android

Depending on which OS the application is installed on, the TOE either invokes the underlying platform or implements its own cryptographic module to perform cryptographic services. All cryptographic mechanisms, whether platform or application provided, use DRBG functionality to support cryptographic operations. Cryptographic functionality includes encryption/decryption services, credential/key storage, key establishment, key destruction, hashing services, signature services, key-hashed message authentication, and key chaining using a password-based derivation function.

Cryptographic services for the application's S/MIME functionality and TLS communications are provided by the underlying platform when the application is installed on a device running iOS/iPadOS. When installed on a device running the Android OS, the TOE invokes the underlying platform

cryptographic libraries for TLS communications and implements an OpenSSL cryptographic module to perform the cryptographic functionality required to support S/MIME (CAVP certificate #A5072).

#### 2.5.2 User Data Protection

The TOE uses S/MIME to digitally sign, verify, decrypt, and encrypt email messages. The TOE stores all application data in an encrypted Boxer database which is created on the mobile device during installation. The TOE's host platforms (iOS, iPadOS, and Android) implement file-based encryption to securely store the data. The TOE restricts its network access and provides user awareness when it attempts to access hardware resources and sensitive data stored on the host platform. The TOE displays notification icons that show S/MIME status. Each status is shown as a different color so that the user can quickly identify any issues.

#### 2.5.3 Identification and Authentication

The TOE relies on the OS to validate X.509.3 certificates for TLS communication. The TOE validates X.509v3 certificates for signing and encrypting emails for S/MIME.

#### 2.5.4 **Security Management**

The TOE enforces the application's enterprise policy set by the UEM administrator pushed out to the managed TOE device. The TOE does not use default passwords, and automatically installs and configures the application to protect itself and its data from unauthorized access while also implementing the recommended platform security mechanisms. Changing one's own password from the application is the only management function that can be performed by the owner/user of the mobile device with the TOE installed.

#### 2.5.5 Privacy

The TOE does not transmit any personally identifiable information (PII) over the network unless voluntarily sent via free text email.

#### 2.5.6 **Protection of the TSF**

The TOE does not support the installation of trusted or untrusted add-ons. The user is able to navigate the platform to check the version of the TOE and also check for updates to the application. All updates come from the Google Play Store (Android) or Apple App Store (iOS and iPadOS). The digital signature of the updates is verified by the mobile device platform prior to being installed. The TOE does not replace or modify its own binaries without user interaction. The TOE implements anti-exploitation features, such as stack-based overflow protection, is compatible with security features provided by the OS, and will only use documented APIs and libraries.

#### 2.5.7 Trusted Path/Channels

The TOE invokes the platform to provide the trusted communication channel between the TOE and the Exchange server. Communications are protected with TLS v1.2. Communication to the Exchange server uses ActiveSync to send and receive emails.

# **3** Conformance Claims

#### 3.1 CC Version

This ST is compliant with Common Criteria for Information Technology Security Evaluation, Version 3.1 Revision 5 April 2017.

#### 3.2 CC Part 2 Conformance Claims

This ST and Target of Evaluation (TOE) are conformant to Part 2 extended to include all applicable NIAP and International interpretations through March 4, 2024.

#### 3.3 CC Part 3 Conformance Claims

This ST and Target of Evaluation (TOE) are conformant to Part 3 extended to include all applicable NIAP and International interpretations through March 4, 2024.

#### 3.4 PP Claims

This ST claims exact conformance to the following Protection Profiles:

- Protection Profile for Application Software Version 1.4 [APP\_PP]
- Application Software Extended Package for Email Clients v2.0 [EC\_EP]

## 3.5 Package Claims

The TOE claims exact compliance to the *Protection Profile for Application Software* and *The Application Software Extended Package for Email Clients*.

The TOE claims following optional SFRs that are defined in the appendices of the claimed PP:

[EC\_EP] FCS\_CKM\_EXT.5

This does not violate the notion of exact conformance because the PP specifically indicates these as allowable options and provides both the ST author and evaluation laboratory with instructions on how these claims are to be documented and evaluated.

# 3.6 Package Name Conformant or Package Name Augmented

This ST and TOE claim exact conformance to the [APP\_PP] and [EC\_EP].

#### 3.7 Conformance Claim Rationale

The [APP\_PP] states the following:

"The application, which consists of the software provided by its vendor, is installed onto the platform(s) it operates on. It executes on the platform, which may be an operating system, hardware environment, a software based execution environment, or some combination of these."

"Applications include a diverse range of software such as office suites, thin clients, PDF readers, downloadable smartphone apps, and apps running in a cloud container. The TOE includes any software in

the application installation package, even those pieces that may extend or modify the functionality of the underlying platform, such as kernel drivers."

The [EC\_EP] states the following:

"Email clients are user applications that provide functionality to send, receive, access and manage email. The complexity of email content and email clients has grown over time. Modern email clients can render HTML as well as plaintext, and may include functionality to display common attachment formats, such as Adobe PDF and Microsoft Word documents. Some email clients allow their functionality to be modified by users through the addition of add-ons. Protocols have also been defined for communicating between email clients and servers. Some clients support multiple protocols for doing the same task, allowing them to be configured according to email server specifications."

The Application Software Email Client TOE type is justified because the TOE is application software that is installed on mobile devices which provides email client services that allows the user to receive, send, manage, and access enterprise email on their mobile device.

#### 3.8 Technical Decisions

Technical Decisions that effected the SFR wording have been annotated with a Footnote.

The following is a complete list of Technical Decisions that apply to the [APP\_PP] and [EC\_PP] evaluation activities that must be performed during the evaluation of this TOE:

"	Title	References	Changes			Analysis to this evaluation	
TD#			SFR	AA	Notes	NA	Reason
TD0815	Addition of Conditional TSS Activity for FPT AEX EXT.1.5	FPT_AEX_EXT.1.5		X			AA: TSS, Test wording
TD0798	Static Memory Mapping Exceptions	FPT_AEX_EXT.1.1		X			AA: TSS, Test wording
TD0780	FIA X509 EXT.1 Test 4 Clarification	FIA_X509_EXT.1		X			AA: Test wording
TD0756	Update for platform-provided full disk encryption	FDP_DAR_EXT.1		X			AA: Test wording
TD0747	Configuration Storage Option for Android	FMT_MEC_EXT.1		X			AA: Test wording
TD0743	FTP DIT EXT.1.1 Selection exclusivity	FTP_DIT_EXT.1.1	X		X		SFR: wording change Notes: wording change Footnote 16,17,18
TD0736	Number of elements for iterations of FCS_HTTPS_EXT.1	FCS_HTTPS_EXT.1.3/Server	X	X		X	Not claiming FCS_HTTPS_EXT.1
TD0719	ECD for PP APP V1.3 and 1.4	PP_APP_v1.3, PP_APP_v1.4			X		Addition of the extended definitions that were missing from Evaluation Activities for PP_APP_v1.3 to PP_APP_v1.4.
TD0717	Format changes for PP APP V1.4	FCS_CKM.1, FCS_CKM.2, FCS_CKM.1/AK,	X				SFR: wording change

# VMware Workspace ONE Boxer Email Client

		FCS_CKM.1/PBKDF, FCS_COP.1/Hash, FCS_COP.1/KeyedHash, FCS_COP.1/Sig, FCS_COP.1/SKC					Footnote 1, 2, 8, 9, 10, 11
TD0664	Testing activity for FPT TUD EXT.2.2	FPT_TUD_EXT.2.2		X			AA: Test wording
TD0650	Conformance claim sections updated to allow for MOD VPNC V2.3 and 2.4	Section 2				X	Not claiming PP- Module for VPN Clients, Version 2.4

**Table 7: Technical Decisions** 

<sup>\*</sup> Technical Decisions that apply to the Application Software Extended Package for Email Clients v2.0 [EC\_PP].

# 4 Security Problem Definition

The security problem definition content from the [EC\_EP] is explicitly marked but content from the [APP\_PP] is not likewise distinguished in this section.

#### 4.1 Threats

This section identifies the threats against the TOE. These threats have been taken from the [APP\_PP] and [EC\_EP].

Threat	Threat Definition
T.FLAWED_ADDON [EC_EP]	Email client functionality can be extended with integration of third-party utilities and tools. This expanded set of capabilities is made possible via the use of add-ons. The tight integration between the basic email client code and the new capabilities that add-ons provide increases the risk that malefactors could inject serious flaws into the email client application, either maliciously by an attacker, or accidentally by a developer. These flaws enable undesirable behaviors including, but not limited to, allowing unauthorized access to sensitive information in the email client, unauthorized access to the device's file system, or even privilege escalation that enables unauthorized access to other applications or the operating system.
T.LOCAL_ATTACK	An attacker can act through unprivileged software on the same computing platform on which the application executes. Attackers may provide maliciously formatted input to the application in the form of files or other local communications.
T.NETWORK_ATTACK	An attacker is positioned on a communications channel or elsewhere on the network infrastructure. Attackers may engage in communications with the application software or alter communications between the application software and other endpoints in order to compromise it.
T.NETWORK_EAVESDROP	An attacker is positioned on a communications channel or elsewhere on the network infrastructure. Attackers may monitor and gain access to data exchanged between the application and other endpoints.
T.PHYSICAL_ACCESS	An attacker may try to access sensitive data at rest.

**Table 8: TOE Threats** 

# 4.2 Organizational Security Policies

There are no Organizational Security Policies in the [APP\_PP] or [EC\_EP].

# 4.3 Assumptions

The specific conditions listed in this section are assumed to exist in the TOE's Operational Environment. These assumptions have been taken from the [APP\_PP] or [EC\_EP].

Assumption	<b>Assumption Definition</b>
A.PLATFORM	The TOE relies upon a trustworthy computing platform with a reliable time clock for its execution. This includes the underlying platform and whatever runtime environment it provides to the TOE.
A.PROPER_ADMIN	The administrator of the application software is not careless, willfully negligent or hostile, and administers the software in compliance with the applied enterprise security policy.

Assumption	Assumption Definition		
A.PROPER_USER	The user of the application software is not willfully negligent or hostile, and uses the software in compliance with the applied enterprise security policy.		

**Table 9: TOE Assumptions** 

# 4.4 Security Objectives

This section identifies the security objectives of the TOE and its supporting environment. The security objectives identify the responsibilities of the TOE and its environment in meeting the security needs.

## 4.4.1 **TOE Security Objectives**

This section identifies the security objectives of the TOE. These objectives have been taken directly from the [APP\_PP] or [EC\_EP].

Objective	Objective Definition
O.ADDON_INTEGRITY [EC_EP]  To address issues associated with malicious or flawed plug-ins or e conformant email clients implement mechanisms to ensure their intincludes verification at installation time and update.	
O.INTEGRITY	Conformant TOEs ensure the integrity of their installation and update packages, and also leverage execution environment-based mitigations. Software is seldom, if ever, shipped without errors. The ability to deploy patches and updates to fielded software with integrity is critical to enterprise network security. Processor manufacturers, compiler developers, execution environment vendors, and operating system vendors have developed execution environment-based mitigations that increase the cost to attackers by adding complexity to the task of compromising systems. Application software can often take advantage of these mechanisms by using APIs provided by the runtime environment or by enabling the mechanism through compiler or linker options.
O.MANAGEMENT	To facilitate management by users and the enterprise, conformant TOEs provide consistent and supported interfaces for their security-relevant configuration and maintenance. This includes the deployment of applications and application updates through the use of platform-supported deployment mechanisms and formats, as well as providing mechanisms for configuration. This also includes providing control to the user regarding disclosure of any PII.
O.PROTECTED_COMMS	To address both passive (eavesdropping) and active (packet modification) network attack threats, conformant TOEs will use a trusted channel for sensitive data. Sensitive data includes cryptographic keys, passwords, and any other data specific to the application that should not be exposed outside of the application.
O.PROTECTED_STORAGE	To address the issue of loss of confidentiality of user data in the event of loss of physical control of the storage medium, conformant TOEs will use data-at-rest protection. This involves encrypting data and keys stored by the TOE in order to prevent unauthorized access to this data. This also includes unnecessary network communications whose consequence may be the loss of data.
O.QUALITY	To ensure quality of implementation, conformant TOEs leverage services and APIs provided by the runtime environment rather than implementing their own versions of these services and APIs. This is especially important for cryptographic services and other complex operations such as file and media parsing. Leveraging this platform behavior relies upon using only documented and supported APIs.

**Table 10: TOE Objectives** 

#### 4.4.2 Security Objectives for the Operational Environment

The TOE's operational environment must satisfy the following objectives:

Objective	Objective Definition	
OF BY A THOUSAND	The TOE relies upon a trustworthy computing platform for its	
OE.PLATFORM	execution. This includes the underlying operating system and any	
	discrete execution environment provided to the TOE.	
	The administrator of the application software is not careless, willfully	
OE.PROPER_ADMIN	negligent or hostile, and administers the software within compliance	
	of the applied enterprise security policy.	
	The user of the application software is not willfully negligent or	
OE.PROPER_USER	hostile, and uses the software within compliance of the applied	
	enterprise security policy.	

**Table 11: Operational Environment Objectives** 

# 4.5 Security Problem Definition Rationale

The assumptions, threats, OSPs, and objectives that are defined in this ST represent the assumptions, threats, OSPs, and objectives that are specified in the Protection Profiles to which the TOE claims conformance. The associated mappings of assumptions to environmental objectives, SFRs to TOE objectives, and OSPs and objectives to threats are therefore identical to the mappings that are specified in the claimed Protection Profiles.

# 5 Extended Components Definition

# 5.1 Extended Security Functional Requirements

The extended Security Functional Requirements that are claimed in this ST are taken directly from the PPs to which the ST and TOE claim conformance. These extended components are formally defined in the PPs in which their usage is required.

# **5.2** Extended Security Assurance Requirements

The extended Security Assurance Requirement that is claimed in this ST is taken directly from the PP to which the ST and TOE claim conformance. This extended component is formally defined in the PP in which its usage is required.

# **6 Security Functional Requirements**

#### **6.1** Conventions

The CC permits four functional component operations—assignment, refinement, selection, and iteration—to be performed on functional requirements. This ST will highlight the operations in the following manner:

- Assignment: allows the specification of an identified parameter. Indicated with *italicized text*.
- **Refinement:** allows the addition of details. Indicated with **bold text**.
- **Selection:** allows the specification of one or more elements from a list. Indicated with <u>underlined</u> text.
- **Iteration operation:** are identified with a number inside parentheses (e.g. "(1)")

When multiple operations are combined, such as an assignment that is provided as an option within a selection or refinement, a combination of the text formatting is used.

Text that is formatted in a claimed PP, such as if the PP's instantiation of the SFR has a refinement (bolded font), or a completed assignment (inside brackets), the formatting is not preserved when reproduced in this ST. Only the assignments and selections made by the ST author are within [brackets]. This is so that the reader can easily identify the operations that are performed by the ST author.

# **6.2** Security Functional Requirements Summary

The following tables list the SFRs claimed by the TOE per platform. SFRs that originate from the Application Software Protection Profile are denoted by a [APP\_PP], SFRs that originated from the Email Client Extended Package are denoted by [EC\_EP].

Class Name	Component Identification	Component Name
	[APP_PP] FCS_CKM_EXT.1	Cryptographic Key Generation Services
	[APP_PP] FCS_CKM.1/AK	Cryptographic Asymmetric Key Generation
	[APP_PP] FCS_CKM.2	Cryptographic Key Establishment
	[EC_EP] FCS_CKM_EXT.3	Protection of Key and Key Material
	[EC_EP] FCS_CKM_EXT.4	Cryptographic Key Destruction
	[EC_EP] FCS_CKM_EXT.5	Cryptographic Key Derivation
Countagnaphia	[EC_EF] FCS_CKW_EXT.5	(Password/Passphrase Conditioning)
Cryptographic Support	[EC_EP] FCS_COP_EXT.2 (iOS)	Key Wrapping
Support	[EC_EP] FCS_IVG_EXT.1	Initialization Vector Generation
	[EC_EP] FCS_KYC_EXT.1	Key Chaining
	[APP_PP] FCS_RBG_EXT.1 (iOS)	Random Bit Generation Services
	[EC_EP] FCS_SMIME_EXT.1	Secure/Multipurpose Internet Mail Extension
	[EC_EF] FCS_SWIIWIE_EAT.1	(S/MIME)
	[APP_PP] FCS_STO_EXT.1(1)	Storage of Credentials
	[APP_PP] FCS_STO_EXT.1(2)	Storage of Credentials (Revocation)
	[APP_PP] FDP_DAR_EXT.1	Encryption of Sensitive Application Data
User Data Protection	[APP_PP] FDP_DEC_EXT.1 (iOS)	Access to Platform Resources
User Data Frotection	[APP_PP] FDP_NET_EXT.1	Network Communications
	[EC_EP] FDP_NOT_EXT.1	Notification of S/MIME Status

Class Name	Component Identification	Component Name
	[EC_EP] FDP_SMIME_EXT.1	S/MIME
Identification and	[APP_PP] FIA_X509_EXT.1	X.509 Authentication and Encryption
Authentication	[APP_PP] FIA_X509_EXT.2	X.509 Authentication and Encryption
Authentication	[EC_EP] FIA_X509_EXT.3	X.509 Authentication and Encryption
	[APP_PP] FMT_CFG_EXT.1	Secure by Default Configuration
Security Management	[APP_PP] FMT_MEC_EXT.1	Supported Configuration Mechanism
Security Management	[EC_EP] FMT_MOF_EXT.1	Management of Functions Behavior
	[APP_PP] FMT_SMF.1	Specification of Management Functions
Privacy	[APP_PP] FPR_ANO_EXT.1	User Consent for Transmission of Personally
Tilvacy	[AFF_FF] FFK_ANO_EXT.1	Identifiable Information
	[APP_PP] FPT_AEX_EXT.1	Anti-Exploitation Capabilities
	[EC_EP] FPT_AON_EXT.1	Support for Only Trusted Add-ons
	[APP_PP] FPT_API_EXT.1	Use of Supported Services and APIs
Protection of the TSF	[APP_PP] FPT_IDV_EXT.1 (iOS)	Software Identification and Versions
	[APP_PP] FPT_LIB_EXT.1	Use of Third Party Libraries
	[APP_PP] FPT_TUD_EXT.1	Integrity for Installation and Update
	[APP_PP] FPT_TUD_EXT.2	Integrity for Installation and Update
Trusted	[APP_PP] FTP_DIT_EXT.1 (iOS)	Protection of Data in Transit
Path/Channels	[EC_EP] FTP_ITC_EXT.1	Inter-TSF Trusted Channel

Table 12: iOS Security Functional Requirements for the TOE

Class Name	Component Identification	Component Name
	[APP_PP] FCS_CKM_EXT.1	Cryptographic Key Generation Services
	[APP_PP] FCS_CKM.1/AK	Cryptographic Asymmetric Key Generation
	[APP_PP] FCS_CKM.2	Cryptographic Key Establishment
	[EC_EP] FCS_CKM_EXT.3	Protection of Key and Key Material
	[EC_EP] FCS_CKM_EXT.4	Cryptographic Key Destruction
	[EC_EP] FCS_CKM_EXT.5	Cryptographic Key Derivation
	[EC_EI] FeS_CKW_EXT.5	(Password/Passphrase Conditioning)
	[APP_PP] FCS_COP.1/SKC	Cryptographic Operation –
	[APP_PP] FCS_COP.1/SKC	Encryption/Decryption (Android)
	[APP_PP] FCS_COP.1/Hash	Cryptographic Operation – Hashing (Android)
Cryptographic	[APP_PP] FCS_COP.1/Sig	Cryptographic Operation – Signing (Android)
Support	[APP_PP] FCS_COP.1/KeyedHash	Cryptographic Operation - Keyed-Hash
		Message Authentication (Android)
	[EC_EP] FCS_COP_EXT.2 (Android)	Key Wrapping
	[EC_EP] FCS_IVG_EXT.1	Initialization Vector Generation
	[EC_EP] FCS_KYC_EXT.1	Key Chaining
	[APP_PP] FCS_RBG_EXT.1 (Android)	Random Bit Generation Services
	[APP_PP] FCS_RBG_EXT.2 (Android)	Random Bit Generation from Application
	[EC_EP] FCS_SMIME_EXT.1	Secure/Multipurpose Internet Mail Extension
	[EC_EF] FCS_SWIIWIE_EXT.1	(S/MIME)

Table 14: iPadOS Security Functional Requirements for the TOE

# **6.3** Security Functional Requirements

#### 6.3.1 Class FCS: Cryptographic Support

#### 6.3.1.1 [APP\_PP] FCS\_CKM\_EXT.1 Cryptographic Key Generation Services

#### FCS\_CKM\_EXT.1.1<sup>1</sup>

The application shall [

• invoke platform-provided functionality for asymmetric key generation].

#### 6.3.1.2 [APP\_PP] FCS\_CKM.1/AK Cryptographic Asymmetric Key Generation

#### FCS CKM.1.1/AK<sup>2</sup>

The application shall [

• <u>invoke platform-provided functionality</u>]

to generate asymmetric cryptographic keys in accordance with a specified cryptographic key generation algorithm [

- RSA schemes using cryptographic key sizes of 2048-bit or greater that meet the following: FIPS PUB 186-4, "Digital Signature Standard (DSS)", Appendix B.3;
- ECC schemes using "NIST curves" P-384 and [P-256] that meet the following: FIPS PUB 186-4, "Digital Signature Standard (DSS)", Appendix B.4

-

<sup>&</sup>lt;sup>1</sup> TD0717

<sup>&</sup>lt;sup>2</sup> TD0717

1.

#### 6.3.1.3 [APP\_PP] FCS\_CKM.2 Cryptographic Key Establishment

#### FCS\_CKM.2.1

The application shall [invoke platform-provided functionality] to perform cryptographic key establishment in accordance with a specified cryptographic key establishment method: [

- RSA-based key establishment schemes that meets the following: NIST Special Publication 800-56B, "Recommendation for Pair-Wise Key Establishment Schemes Using Integer Factorization Cryptography",
- Elliptic curve-based key establishment schemes that meets the following: NIST Special Publication 800-56A, "Recommendation for Pair-Wise Key Establishment Schemes Using Discrete Logarithm Cryptography"

1.

#### 6.3.1.4 [EC\_EP] FCS\_CKM\_EXT.3 Protection of Key and Key Material

#### FCS CKM EXT.3.1

The email client shall [only store keys in non-volatile memory when wrapped as specified in FCS\_COP\_EXT.2 unless the key meets any one of following criteria: [

The plaintext key is the public portion of the key pair

]].

#### 6.3.1.5 [EC\_EP] FCS\_CKM\_EXT.4 Cryptographic Key Destruction

#### FCS\_CKM\_EXT.4.1<sup>3</sup>

The email client shall [

- invoke platform-provided key destruction,
- implement key destruction using [
  - o For volatile memory, the erasure shall be executed by a single direct overwrite [
    - consisting of zeroes]
  - o For nonvolatile storage, the erasure shall be executed by [
    - single]

overwrite of key data storage location consisting of [

• a static pattern]]

] that meet the following: [

NIST SP800-88]

\_

<sup>&</sup>lt;sup>3</sup> TD0352

for destroying all keying material and cryptographic security parameters when no longer needed.

# 6.3.1.6 [EC\_EP] FCS\_CKM\_EXT.5 Cryptographic Key Derivation (Password/Passphrase Conditioning)

#### FCS CKM EXT.5.14

The TSF shall support a password/passphrase of up to [512] characters used to generate a password authorization factor.

#### FCS CKM EXT.5.25

The TSF shall allow passwords to be composed of any combination of upper case characters, lower case characters, numbers, and the following special characters: "!", "@", "#", "\$", "%", "%", "%", "%", "%", "%", and [no other characters].

#### FCS CKM EXT.5.36

The TSF shall perform Password-based Key Derivation Functions in accordance with a specified cryptographic algorithm HMAC- [SHA-256], with [10k for iOS and iPadOS, 20k for Android] iterations, and output cryptographic key sizes [256] bits that meet the following: NIST SP 800-132.

#### FCS CKM EXT.5.47

The TSF shall not accept passwords less than [a value settable by the administrator] and greater than the maximum password length defined in FCS\_CKM\_EXT.5.1.

#### 6.3.1.7 [APP\_PP] FCS\_COP.1/SKC Cryptographic Operation – Encryption/Decryption (Android)

#### FCS COP.1.1/SKC<sup>8</sup>

The application shall perform encryption/decryption in accordance with a specified cryptographic algorithm [

- AES-CBC (as defined in NIST SP 800-38A) mode
- AES-CTR (as defined in NIST SP 800-38A) mode

and cryptographic key sizes [128-bit, 256-bit].

#### 6.3.1.8 [APP\_PP] FCS\_COP.1/Hash Cryptographic Operation – Hashing (Android)

#### FCS\_COP.1.1/Hash<sup>9</sup>

The application shall perform cryptographic hashing services in accordance with a specified cryptographic algorithm [

<sup>5</sup> TD0266

<sup>6</sup> TD0266

<sup>7</sup> TD0266

<sup>8</sup> TD0717

<sup>9</sup> TD0717

<sup>&</sup>lt;sup>4</sup> TD0266

#### Security Target

- SHA-256,
- SHA-384,
- SHA-512]

and message digest sizes [

- 256,
- 384,
- <u>512</u>]

bits that meet the following: FIPS Pub 180-4.

# 6.3.1.9 [APP\_PP] FCS\_COP.1/Sig Cryptographic Operation – Signing (Android)

#### FCS\_COP.1.1/Sig10

The application shall perform cryptographic signature services (generation and verification) in accordance with a specified cryptographic algorithm [

• RSA schemes using cryptographic key sizes of 2048-bit or greater that meet the following: FIPS PUB 186-4, "Digital Signature Standard (DSS)", Section 5

].

# 6.3.1.10 [APP\_PP] FCS\_COP.1/KeyedHash Cryptographic Operation - Keyed-Hash Message Authentication (Android)

#### FCS COP.1.1/KeyedHash<sup>11</sup>

The application shall perform keyed-hash message authentication in accordance with a specified cryptographic algorithm [

• <u>HMAC-SHA-256</u>]

and [

• <u>no other algorithms</u>]

with key sizes [256 bits] and message digest sizes [256] and [no other size] bits that meet the following: FIPS Pub 198-1 The Keyed-Hash Message Authentication Code and FIPS Pub 180-4 Secure Hash Standard.

#### 6.3.1.11 [EC\_EP] FCS\_COP\_EXT.2 (iOS) Key Wrapping

#### FCS COP EXT.2.1(iOS)

The email client shall

[use platform-provided functionality to perform Key Wrapping]

in accordance with a specified cryptographic algorithm

1 \_ 11

<sup>&</sup>lt;sup>10</sup> TD0717

<sup>&</sup>lt;sup>11</sup> TD0717

[AES Key Wrap]

and the cryptographic key size

[256 bits (AES)]

that meet the following: ["NIST SP 800-38F" for Key Wrap (section 6.2) and Key Wrap with Padding (section 6.3)].

#### 6.3.1.12 [EC\_EP] FCS\_COP\_EXT.2 (Android) Key Wrapping

#### FCS COP EXT.2.1(Android)

The email client shall

[implement functionality to perform Key Wrapping]

in accordance with a specified cryptographic algorithm

[AES Key Wrap]

and the cryptographic key size

[256 bits (AES)]

that meet the following: ["NIST SP 800-38F" for Key Wrap (section 6.2) and Key Wrap with Padding (section 6.3)].

#### 6.3.1.13 [EC\_EP] FCS\_COP\_EXT.2 (iPadOS) Key Wrapping

#### FCS COP EXT.2.1(iPadOS)

The email client shall

[use platform-provided functionality to perform Key Wrapping]

in accordance with a specified cryptographic algorithm

[AES Key Wrap]

and the cryptographic key size

[256 bits (AES)]

that meet the following: ["NIST SP 800-38F" for Key Wrap (section 6.2) and Key Wrap with Padding (section 6.3)].

#### 6.3.1.14 [EC\_EP] FCS\_IVG\_EXT.1 Initialization Vector Generation

#### FCS IVG EXT.1.1

The email client shall create IVs in the following manner: [CBC: IVs shall be non-repeating].

# 6.3.1.15 [EC\_EP] FCS\_KYC\_EXT.1 Key Chaining

#### FCS\_KYC\_EXT.1.1

The email client shall maintain a key chain of:

[intermediate keys originating from: [a password as specified in FCS\_CKM\_EXT.5.1]]

to the data encryption/decryption key(s) using the following method(s):

[implement Key Wrapping as specified in FCS\_COP\_EXT.2]

while maintaining an effective strength of [256 bits].

#### 6.3.1.16 [APP\_PP] FCS\_RBG\_EXT.1 (iOS) Random Bit Generation Services

#### FCS\_RBG\_EXT.1.1(iOS)

The application shall [invoke platform-provided DRBG functionality] for its cryptographic operations.

#### 6.3.1.17 [APP\_PP] FCS\_RBG\_EXT.1 (Android) Random Bit Generation Services

#### FCS\_RBG\_EXT.1.1(Android)

The application shall [invoke platform-provided DRBG functionality, implement DRBG functionality] for its cryptographic operations.

#### 6.3.1.18 [APP\_PP] FCS\_RBG\_EXT.1 (iPadOS) Random Bit Generation Services

#### FCS RBG EXT.1.1(iPadOS)

The application shall [invoke platform-provided DRBG functionality] for its cryptographic operations.

#### 6.3.1.19 [APP PP] FCS RBG EXT.2 (Android) Random Bit Generation from Application

#### FCS\_RBG\_EXT.2.1

The application shall perform all deterministic random bit generation (DRBG) services in accordance with NIST Special Publication 800-90A using [CTR\_DRBG (AES)].

#### FCS\_RBG\_EXT.2.2

The deterministic RBG shall be seeded by an entropy source that accumulates entropy from a platform-based DRBG and [

• no other noise source]

with a minimum of [

• 256 bits]

of entropy at least equal to the greatest security strength (according to NIST SP 800-57) of the keys and hashes that it will generate.

#### 6.3.1.20 [EC\_EP] FCS\_SMIME\_EXT.1 Secure/Multipurpose Internet Mail Extension (S/MIME)

#### FCS\_SMIME\_EXT.1.1<sup>12</sup>

The email client shall implement both a sending and receiving S/MIME v4.0 Agent as defined in RFC 8551, using CMS as defined in RFCs 5652, 5754, and 3565.

#### FCS\_SMIME\_EXT.1.2<sup>13</sup>

The email client shall transmit the ContentEncryptionAlgorithmIdentifier for AES-128 CBC, AES-256 CBC and [no other] as part of the S/MIME protocol.

#### FCS SMIME EXT.1.3

The email client shall present the digestAlgorithm field with the following Message Digest Algorithm identifiers [id-sha256, id-sha384, id-sha512] and no others as part of the S/MIME protocol.

#### FCS\_SMIME\_EXT.1.4<sup>14</sup>

The email client shall present the signatureAlgorithm field with the following sha256withRSAEncryption and [no other algorithms] as part of the S/MIME protocol.

#### FCS\_SMIME\_EXT.1.5

The email client shall support use of different private keys (and associated certificates) for signature and for encryption as part of the S/MIME protocol.

#### FCS\_SMIME\_EXT.1.6

The email client shall only accept a signature from a certificate with the digitalSignature bit set as part of the S/MIME protocol.

#### FCS\_SMIME\_EXT.1.7

The email client shall implement mechanisms to retrieve certificates and certificate revocation information [[at a frequency equal to the value received from OCSP responder or an administratively set value which overrides the value from OCSP responder]] as part of the S/MIME protocol.

#### 6.3.1.21 [APP\_PP] FCS\_STO\_EXT.1(1) Storage of Credentials

#### FCS\_STO\_EXT.1.1(1)

The application shall [

- invoke the functionality provided by the platform to securely store [Android credentials defined in Table 17, iOS/iPadOS credentials defined in Table 18].
- implement functionality to securely store [Android credentials defined in Table 17] according to [FCS\_COP.1/SKC]

1	to	nonvo	latile	memory
---	----	-------	--------	--------

<sup>13</sup> TD0560

<sup>&</sup>lt;sup>12</sup> TD0560

<sup>14</sup> TD0560

#### 6.3.1.22 [APP\_PP] FCS\_STO\_EXT.1(2) Storage of Credentials (Revocation)

#### FCS\_STO\_EXT.1.1(2)

The application shall [

- invoke the functionality provided by the platform to securely store [iOS platform S/MIME revocation status information, iPadOS platform S/MIME revocation status information],
- implement functionality to securely store [Android platform S/MIME revocation status information] according to [FCS\_COP.1/SKC]

] to nonvolatile memory.

#### 6.3.2 Class FDP: User Data Protection

#### 6.3.2.1 [APP PP] FDP DAR EXT.1 Encryption of Sensitive Application Data

#### FDP\_DAR\_EXT.1.1

The application shall [

- leverage platform-provided functionality to encrypt sensitive data,
- protect sensitive data in accordance with FCS STO EXT.1]

in non-volatile memory.

#### 6.3.2.2 [APP\_PP] FDP\_DEC\_EXT.1 (iOS) Access to Platform Resources

#### FDP DEC EXT.1.1(iOS)

The application shall restrict its access to [

- network connectivity,
- camera,
- [device storage, phone, and touch/face ID]].

#### FDP\_DEC\_EXT.1.2(iOS)

The application shall restrict its access to [

- address book,
- calendar].

#### 6.3.2.3 [APP\_PP] FDP\_DEC\_EXT.1 (Android) Access to Platform Resources

#### FDP\_DEC\_EXT.1.1(Android)

The application shall restrict its access to [

- network connectivity,
- camera,
- NFC,
- [device storage, phone, fingerprint, and vibrator]].

#### FDP\_DEC\_EXT.1.2(Android)

The application shall restrict its access to [

- address book,
- calendar
- [accounts, profile]].

#### 6.3.2.4 [APP\_PP] FDP\_DEC\_EXT.1 (iPadOS) Access to Platform Resources

#### FDP\_DEC\_EXT.1.1(iPadOS)

The application shall restrict its access to [

- network connectivity,
- camera,
- [device storage, phone, and touch/face ID]].

#### FDP\_DEC\_EXT.1.2(iPadOS)

The application shall restrict its access to [

- address book,
- <u>calendar</u>].

#### 6.3.2.5 [APP\_PP] FDP\_NET\_EXT.1 Network Communications

#### FDP\_NET\_EXT.1.1

The application shall restrict network communication to [

- <u>user-initiated communication for [sending email, forcing sync (calendar, address book, email)</u>, Global Address List (GAL) lookup, email search],
- [application initiated actions: ActiveSync (calendar, address book, email), OCSP for S/MIME revocation checking, Version Information Check]

].

#### 6.3.2.6 [EC\_EP] FDP\_NOT\_EXT.1 Notification of S/MIME Status

#### FDP NOT EXT.1.1

The email client shall display a notification of the S/MIME status of received emails upon viewing.

#### 6.3.2.7 [EC EP] FDP SMIME EXT.1 S/MIME

#### FDP SMIME EXT.1.1

The email client shall use S/MIME to sign, verify, encrypt, and decrypt mail.

#### 6.3.3 Class FIA: Identification and Authentication

#### 6.3.3.1 [APP\_PP] FIA\_X509\_EXT.1 X.509 Certificate Validation

#### FIA\_X509\_EXT.1.1

The application shall [invoke platform-provided functionality] to validate certificates in accordance with the following rules:

- RFC 5280 certificate validation and certificate path validation
- The certificate path must terminate with a trusted CA certificate
- The application shall validate a certificate path by ensuring the presence of the basicConstraints extension, that the CA flag is set to TRUE for all CA certificates, and that any path constraints are met
- The application shall validate that any CA certificate includes caSigning purpose in the key usage field
- The application shall validate the revocation status of the certificate using [OCSP as specified in RFC 6960]
- The application shall validate the extendedKeyUsage (EKU) field according to the following rules:
  - Certificates used for trusted updates and executable code integrity verification shall have the Code Signing Purpose (id-kp 3 with OID 1.3.6.1.5.5.7.3.3) in the extendedKeyUsage field
  - Server certificates presented for TLS shall have the Server Authentication purpose (id-kp 1 with OID 1.3.6.1.5.5.7.3.1) in the EKU field.
  - O Client certificates presented for TLS shall have the Client Authentication purpose (id-kp 2 with OID 1.3.6.1.5.5.7.3.2) in the EKU field.
  - o S/MIME certificates presented for email encryption and signature shall have the Email Protection purpose (id-kp 4 with OID 1.3.6.1.5.5.7.3.4) in the EKU field.
  - OCSP certificates presented for OCSP responses shall have the OCSP Signing purpose (id-kp 9 with OID 1.3.6.1.5.5.7.3.9) in the EKU field.
  - Server certificates presented for EST shall have the CMC Registration Authority (RA) purpose (id-kp-cmcRA with OID 1.3.6.1.5.5.7.3.28) in the EKU field.

#### FIA\_X509\_EXT.1.2

The application shall only treat a certificate as a CA certificate if the basicConstraints extension is present and the CA flag is set to TRUE.

#### 6.3.3.2 [APP PP] FIA X509 EXT.2 X.509 Certificate Authentication

#### FIA X509 EXT.2.1

The application shall use X.509v3 certificates as defined by RFC 5280 to support authentication for [TLS].

#### FIA\_X509\_EXT.2.2

When the application cannot establish a connection to determine the validity of a certificate, the application shall [allow the administrator to choose whether to accept the certificate in these cases].

#### 6.3.3.3 [EC\_EP] FIA\_X509\_EXT.3 X.509 Authentication and Encryption

#### FIA X509 EXT.3.1

The email client shall use X.509v3 certificates as defined by RFC 5280 to support encryption and authentication for S/MIME.

#### FIA X509 EXT.3.2

The email client shall prevent the establishment of a trusted communication channel when the peer certificate is deemed invalid.

#### FIA\_X509\_EXT.3.3

The email client shall prevent the installation of code if the code signing certificate is deemed invalid.

#### FIA\_X509\_EXT.3.4

The email client shall prevent the encryption of email if the email protection certificate is deemed invalid.

#### FIA\_X509\_EXT.3.5

The email client shall prevent the signing of email if the email protection certificate is deemed invalid.

#### 6.3.4 Class FMT: Security Management

#### 6.3.4.1 [APP\_PP] FMT\_CFG\_EXT.1 Secure by Default Configuration

#### FMT\_CFG\_EXT.1.1

The application shall provide only enough functionality to set new credentials when configured with default credentials or no credentials.

#### FMT\_CFG\_EXT.1.2

The application shall be configured by default with file permissions which protect the application binaries and data files from modification by normal unprivileged users.

#### 6.3.4.2 [APP\_PP] FMT\_MEC\_EXT.1 Supported Configuration Mechanism

#### FMT\_MEC\_EXT.1.1

The application shall [

• <u>invoke the mechanisms recommended by the platform vendor for storing and setting configuration options</u>].

#### 6.3.4.3 [EC\_EP] FMT\_MOF\_EXT.1 Management of Functions Behavior

#### FMT\_MOF\_EXT.1.1

The email client shall be capable of performing the following management functions, controlled by the user or administrator as shown:

## X: Mandatory O: Optional

Management Function	Administrator	User
Enable/disable plaintext only mode globally and by [no other method]	0	
Configure message sending/receiving to only use cryptographic algorithms defined in FCS_SMIME_EXT.1	0	
Change password/passphrase authentication credential		0
Configure cryptographic functionality	0	
[Configure Password Complexity Policy: Length	0	
Configure OCSP retrieval frequency]	0	

# 6.3.4.4 [APP\_PP] FMT\_SMF.1 Specification of Management Functions

# FMT\_SMF.1.1

The TSF shall be capable of performing the following management functions [

• [Change password/passphrase authentication credential]

].

# 6.3.5 Class FPR: Privacy

# 6.3.5.1 [APP\_PP] FPR\_ANO\_EXT.1 User Consent for Transmission of Personally Identifiable Information

# FPR\_ANO\_EXT.1.1

The application shall [

• not transmit PII over a network].

# 6.3.6 Class FPT: Protection of the TSF

## 6.3.6.1 [APP\_PP] FPT\_AEX\_EXT.1 Anti-Exploitation Capabilities

# FPT\_AEX\_EXT.1.1

The application shall not request to map memory at an explicit address except for [the designated use of mmap for the use of "reallocating" memory to expand the Boxer database file map].

# FPT\_AEX\_EXT.1.2

The application shall [

• not allocate any memory region with both write and execute permissions].

#### FPT AEX EXT.1.3

The application shall be compatible with security features provided by the platform vendor.

## FPT\_AEX\_EXT.1.4

The application shall not write user-modifiable files to directories that contain executable files unless explicitly directed by the user to do so.

## FPT\_AEX\_EXT.1.5

The application shall be built with stack-based buffer overflow protection enabled.

## 6.3.6.2 [EC EP] FPT AON EXT.1 Support for Only Trusted Add-ons

## FPT AON EXT.1.1

The email client shall include the capability to load [no add-ons].

# 6.3.6.3 [APP\_PP] FPT\_API\_EXT.1 Use of Supported Services and APIs

### FPT API EXT.1.1

The application shall use only documented platform APIs.

# 6.3.6.4 [APP\_PP] FPT\_IDV\_EXT.1 (iOS) Software Identification and Versions

## FPT\_IDV\_EXT.1.1(iOS)

The application shall be versioned with [[(YY.MM.PP) last two digits of year, two-digit numerical representation of the month of the package release date, patch under minor version]].

## 6.3.6.5 [APP\_PP] FPT\_IDV\_EXT.1 (Android) Software Identification and Versions

# FPT\_IDV\_EXT.1.1(Android)

The application shall be versioned with [[(YY.MM.PP.BB) last two digits of year, two-digit numerical representation of the month of the package release date, patch under minor version, and build number]].

# 6.3.6.6 [APP\_PP] FPT\_IDV\_EXT.1 (iPadOS) Software Identification and Versions

## FPT IDV EXT.1.1(iPadOS)

The application shall be versioned with [[(YY.MM.PP) last two digits of year, two-digit numerical representation of the month of the package release date, patch under minor version]].

# 6.3.6.7 [APP\_PP] FPT\_LIB\_EXT.1 Use of Third Party Libraries

#### FPT LIB EXT.1.1

The application shall be packaged with only [see Android, iOS, and iPadOS list details in Section 8.6.5].

# 6.3.6.8 [APP\_PP] FPT\_TUD\_EXT.1 Integrity for Installation and Update

# FPT\_TUD\_EXT.1.1

The application shall [provide the ability, leverage the platform] to check for updates and patches to the application software.

## FPT TUD EXT.1.2

The application shall [provide the ability] to query the current version of the application software.

## FPT\_TUD\_EXT.1.3

The application shall not download, modify, replace or update its own binary code.

## FPT TUD EXT.1.4

Application updates shall be digitally signed such that the application platform can cryptographically verify them prior to installation.

## FPT\_TUD\_EXT.1.5

The application is distributed [as an additional software package to the platform OS].

# 6.3.6.9 [APP\_PP] FPT\_TUD\_EXT.2 Integrity for Installation and Update

# **FPT TUD EXT.2.1**<sup>15</sup>

The application shall be distributed using [the format of the platform-supported package manager].

# FPT\_TUD\_EXT.2.2

The application shall be packaged such that its removal results in the deletion of all traces of the application, with the exception of configuration settings, output files, and audit/log events.

## FPT TUD EXT.2.3

The application installation package shall be digitally signed such that its platform can cryptographically verify them prior to installation.

## 6.3.7 Class FTP: Trusted Path/Channels

# 6.3.7.1 [APP\_PP] FTP\_DIT\_EXT.1 (iOS) Protection of Data in Transit

# $FTP\_DIT\_EXT.1.1(iOS)^{16}$

The application shall [invoke platform-provided functionality to encrypt all transmitted sensitive data with [TLS] for [sending and receiving emails]] between itself and another trusted IT product.

<sup>16</sup> TD0743

<sup>15</sup> TD0628

# 6.3.7.2 [APP\_PP] FTP\_DIT\_EXT.1 (Android) Protection of Data in Transit

## FTP DIT EXT.1.1(Android)<sup>17</sup>

The application shall [invoke platform-provided functionality to encrypt all transmitted data with [TLS] for [sending and receiving emails]] between itself and another trusted IT product.

# 6.3.7.3 [APP\_PP] FTP\_DIT\_EXT.1 (iPadOS) Protection of Data in Transit

# FTP\_DIT\_EXT.1.1(iPadOS)<sup>18</sup>

The application shall [invoke platform-provided functionality to encrypt all transmitted sensitive data with [TLS] for [sending and receiving emails]] between itself and another trusted IT product.

# 6.3.7.4 If [EC\_EP] FTP\_ITC\_EXT.1 Inter-TSF Trusted Channel

## FTP ITC EXT.1.1

The email client shall initiate or receive communication via the trusted channel.

## FTP\_ITC\_EXT.1.2

The email client shall communicate via the trusted channel for [ActiveSync].

# 6.4 Statement of Security Functional Requirements Consistency

The Security Functional Requirements included in the ST represent all required SFRs specified in the PPs against which exact conformance is claimed a subset of the optional SFRs. All hierarchical relationships, dependencies, and unfulfilled dependency rationales in the ST are considered to be identical to those that are defined in the claimed PP.

<sup>18</sup> TD0743

<sup>&</sup>lt;sup>17</sup> TD0743

# 7 Security Assurance Requirements

This section identifies the Security Assurance Requirements (SARs) that are claimed for the TOE. The SARs which are claimed are in exact conformance with the [APP\_PP] and [EC\_EP].

# 7.1 Class ASE: Security Target

## 7.1.1 ST introduction (ASE\_INT.1)

## 7.1.1.1 Developer action elements:

## ASE\_INT.1.1D

The developer shall provide an ST introduction.

# 7.1.1.2 Content and presentation elements:

# ASE\_INT.1.1C

The ST introduction shall contain an ST reference, a TOE reference, a TOE overview and a TOE description.

## ASE INT.1.2C

The ST reference shall uniquely identify the ST.

## ASE INT.1.3C

The TOE reference shall uniquely identify the TOE.

### ASE INT.1.4C

The TOE overview shall summarize the usage and major security features of the TOE.

#### ASE INT.1.5C

The TOE overview shall identify the TOE type.

## ASE INT.1.6C

The TOE overview shall identify any non-TOE hardware/software/firmware required by the TOE.

### ASE INT.1.7C

The TOE description shall describe the physical scope of the TOE.

#### ASE INT.1.8C

The TOE description shall describe the logical scope of the TOE.

# 7.1.1.3 Evaluator action elements:

## ASE\_INT.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

#### ASE INT.1.2E

The evaluator shall confirm that the TOE reference, the TOE overview, and the TOE description are consistent with each other.

# 7.1.2 Conformance claims (ASE\_CCL.1)

## 7.1.2.1 Developer action elements:

## ASE\_CCL.1.1D

The developer shall provide a conformance claim.

## ASE\_CCL.1.2D

The developer shall provide a conformance claim rationale

# 7.1.2.2 Content and presentation elements:

## ASE\_CCL.1.1C

The conformance claim shall contain a CC conformance claim that identifies the version of the CC to which the ST and the TOE claim conformance.

## ASE\_CCL.1.2C

The CC conformance claim shall describe the conformance of the ST to CC Part 2 as either CC Part 2 conformant or CC Part 2 extended.

#### ASE CCL.1.3C

The CC conformance claim shall describe the conformance of the ST to CC Part 3 as either CC Part 3 conformant or CC Part 3 extended.

## ASE\_CCL.1.4C

The CC conformance claim shall be consistent with the extended components definition.

## ASE CCL.1.5C

The conformance claim shall identify all PPs and security requirement packages to which the ST claims conformance.

## ASE\_CCL.1.6C

The conformance claim shall describe any conformance of the ST to a package as either package-conformant or package-augmented.

## ASE CCL.1.7C

The conformance claim rationale shall demonstrate that the TOE type is consistent with the TOE type in the PPs for which conformance is being claimed.

# ASE\_CCL.1.8C

The conformance claim rationale shall demonstrate that the statement of the security problem definition is consistent with the statement of the security problem definition in the PPs for which conformance is being claimed.

# ASE\_CCL.1.9C

The conformance claim rationale shall demonstrate that the statement of security objectives is consistent with the statement of security objectives in the PPs for which conformance is being claimed.

## ASE\_CCL.1.10C

The conformance claim rationale shall demonstrate that the statement of security requirements is consistent with the statement of security requirements in the PPs for which conformance is being claimed.

# 7.1.2.3 Evaluator action elements:

## ASE\_CCL.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

# 7.1.3 Security problem definition (ASE\_SPD)

### 7.1.3.1 Developer action elements:

## ASE\_SPD.1.1D

The developer shall provide a security problem definition.

# 7.1.3.2 Content and presentation elements:

## ASE SPD.1.1C

The security problem definition shall describe the threats.

# ASE\_SPD.1.2C

All threats shall be described in terms of a threat agent, an asset, and an adverse action.

# ASE\_SPD.1.3C

The security problem definition shall describe the OSPs.

#### ASE SPD.1.4C

The security problem definition shall describe the assumptions about the operational environment of the TOE.

# 7.1.3.3 Evaluator action elements:

# ASE\_SPD.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

# 7.1.4 Security objectives for the operational environment (ASE\_OBJ.1)

# 7.1.4.1 **Developer action elements:**

## ASE\_OBJ.1.1D

The developer shall provide a statement of security objectives.

## 7.1.4.2 Content and presentation elements:

## ASE\_OBJ.1.1C

The statement of security objectives shall describe the security objectives for the operational environment.

#### 7.1.4.3 Evaluator action elements:

## ASE\_OBJ.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

# 7.1.5 Extended components definition (ASE\_ECD.1)

## 7.1.5.1 Developer action elements:

## ASE\_ECD.1.1D

The developer shall provide a statement of security requirements.

## ASE\_ECD.1.2D

The developer shall provide an extended components definition.

## 7.1.5.2 Content and presentation elements:

# ASE\_ECD.1.1C

The statement of security requirements shall identify all extended security requirements.

## ASE\_ECD.1.2C

The extended components definition shall define an extended component for each extended security requirement.

# ASE\_ECD.1.3C

The extended components definition shall describe how each extended component is related to the existing CC components, families, and classes.

## ASE\_ECD.1.4C

The extended components definition shall use the existing CC components, families, classes, and methodology as a model for presentation.

#### ASE\_ECD.1.5C

The extended components shall consist of measurable and objective elements such that conformance or nonconformance to these elements can be demonstrated.

## 7.1.5.3 Evaluator action elements:

## ASE ECD.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

# ASE\_ECD.1.2E

The evaluator shall confirm that no extended component can be clearly expressed using existing components.

# 7.1.6 Stated security requirements (ASE\_REQ.1)

## 7.1.6.1 **Developer action elements:**

## ASE\_REQ.1.1D

The developer shall provide a statement of security requirements.

## ASE\_REQ.1.2D

The developer shall provide a security requirements rationale.

## 7.1.6.2 Content and presentation elements:

# ASE\_REQ.1.1C

The statement of security requirements shall describe the SFRs and the SARs.

## ASE\_REQ.1.2C

All subjects, objects, operations, security attributes, external entities and other terms that are used in the SFRs and the SARs shall be defined.

## ASE\_REQ.1.3C

The statement of security requirements shall identify all operations on the security requirements.

## ASE\_REQ.1.4C

All operations shall be performed correctly.

## ASE REQ.1.5C

Each dependency of the security requirements shall either be satisfied, or the security requirements rationale shall justify the dependency not being satisfied.

# ASE\_REQ.1.6C

The statement of security requirements shall be internally consistent.

## 7.1.6.3 Evaluator action elements:

## ASE\_REQ.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

## 7.1.7 TOE summary specification (ASE\_TSS.1)

## 7.1.7.1 Developer action elements:

## ASE TSS.1.1D

The developer shall provide a TOE summary specification.

# 7.1.7.2 Content and presentation elements:

## ASE\_TSS.1.1C

The TOE summary specification shall describe how the TOE meets each SFR. In the case of entropy analysis, the TSS is used in conjunction with required supplementary information on Entropy.

# 7.1.7.3 Evaluator action elements:

## ASE\_TSS.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

## ASE TSS.1.2E

The evaluator shall confirm that the TOE summary specification is consistent with the TOE overview and the TOE description.

# 7.2 Class ADV: Development

# 7.2.1 Basic Functional Specification (ADV\_FSP.1)

## 7.2.1.1 Developer action elements:

## ADV\_FSP.1.1D

The developer shall provide a functional specification.

# ADV\_FSP.1.2D

The developer shall provide a tracing from the functional specification to the SFRs.

# 7.2.1.2 Content and presentation elements:

# ADV\_FSP.1.1C

The functional specification shall describe the purpose and method of use for each SFR-enforcing and SFR-supporting TSFI.

## ADV FSP.1.2C

The functional specification shall identify all parameters associated with each SFR-enforcing and SFR-supporting TSFI.

## ADV\_FSP.1.3C

The functional specification shall provide rationale for the implicit categorization of interfaces as SFR-non-interfering.

## ADV\_FSP.1.4C

The tracing shall demonstrate that the SFRs trace to TSFIs in the functional specification.

## 7.2.1.3 Evaluator action elements:

## ADV\_FSP.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

# ADV\_FSP.1.2E

The evaluator shall determine that the functional specification is an accurate and complete instantiation of the SFRs.

# 7.3 Class AGD: Guidance Documentation

# 7.3.1 Operational User Guidance (AGD\_OPE.1)

## 7.3.1.1 Developer action elements:

#### AGD OPE.1.1D

The developer shall provide operational user guidance.

# 7.3.1.2 Content and presentation elements:

## AGD\_OPE.1.1C

The operational user guidance shall describe, for each user role, the user-accessible functions and privileges that should be controlled in a secure processing environment, including appropriate warnings.

## AGD\_OPE.1.2C

The operational user guidance shall describe, for each user role, how to use the available interfaces provided by the TOE in a secure manner.

#### AGD\_OPE.1.3C

The operational user guidance shall describe, for each user role, the available functions and interfaces, in particular all security parameters under the control of the user, indicating secure values as appropriate.

# AGD\_OPE.1.4C

The operational user guidance shall, for each user role, clearly present each type of security-relevant event relative to the user-accessible functions that need to be performed, including changing the security characteristics of entities under the control of the TSF.

## AGD\_OPE.1.5C

The operational user guidance shall identify all possible modes of operation of the TOE (including operation following failure or operational error), their consequences, and implications for maintaining secure operation.

#### AGD OPE.1.6C

The operational user guidance shall, for each user role, describe the security measures to be followed in order to fulfill the security objectives for the operational environment as described in the ST.

## AGD\_OPE.1.7C

The operational user guidance shall be clear and reasonable.

## 7.3.1.3 Evaluator action elements:

## AGD\_OPE.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

## 7.3.2 Preparative Procedures (AGD\_PRE.1)

## 7.3.2.1 Developer action elements:

#### AGD PRE.1.1D

The developer shall provide the TOE, including its preparative procedures.

#### 7.3.2.2 Content and presentation elements:

## AGD\_PRE.1.1C

The preparative procedures shall describe all the steps necessary for secure acceptance of the delivered TOE in accordance with the developer's delivery procedures.

## AGD\_PRE.1.2C

The preparative procedures shall describe all the steps necessary for secure installation of the TOE and for the secure preparation of the operational environment in accordance with the security objectives for the operational environment as described in the ST.

#### 7.3.2.3 Evaluator action elements:

# AGD\_PRE.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

## AGD\_PRE.1.2E

The evaluator shall apply the preparative procedures to confirm that the TOE can be prepared securely for operation.

# 7.4 Class ALC: Life Cycle Support

# 7.4.1 Labeling of the TOE (ALC\_CMC.1)

## 7.4.1.1 Developer action elements:

# ALC\_CMC.1.1D

The developer shall provide the TOE and a reference for the TOE.

## 7.4.1.2 Content and presentation elements:

# ALC\_CMC.1.1C

The application shall be labeled with a unique reference.

#### 7.4.1.3 Evaluator action elements:

# ALC\_CMC.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

# 7.4.2 **TOE CM Coverage (ALC\_CMS.1)**

# 7.4.2.1 Developer action elements:

## ALC\_CMS.1.1D

The developer shall provide a configuration list for the TOE.

# 7.4.2.2 Content and presentation elements:

## ALC CMS.1.1C

The configuration list shall include the following: the TOE itself; and the evaluation evidence required by the SARs.

### ALC\_CMS.1.2C

The configuration list shall uniquely identify the configuration items.

## 7.4.2.3 Evaluator action elements:

## ALC\_CMS.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

# 7.4.3 Timely Security Updates (ALC\_TSU\_EXT.1)

# 7.4.3.1 Developer Actions Element:

## ALC\_TSU\_EXT.1.1D

The developer shall provide a description in the TSS of how timely security updates are made to the TOE.

# ALC\_TSU\_EXT.1.2D

The developer shall provide a description in the TSS of how users are notified when updates change security properties or the configuration of the product.

## 7.4.3.2 Content and presentation elements:

## ALC\_TSU\_EXT.1.1C

The description shall include the process for creating and deploying security updates for the TOE software.

## ALC TSU EXT.1.2C

The description shall express the time window as the length of time, in days, between public disclosure of a vulnerability and the public availability of security updates to the TOE.

## ALC\_TSU\_EXT.1.3C

The description shall include the mechanisms publicly available for reporting security issues pertaining to the TOE.

## 7.4.3.3 Evaluator action elements:

## ALC\_TSU\_EXT.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

# 7.5 Class ATE: Tests

# 7.5.1 **Independent Testing - Conformance (ATE\_IND.1)**

# 7.5.1.1 Developer action elements:

# ATE\_IND.1.1D

The developer shall provide the TOE for testing.

# 7.5.1.2 Content and presentation elements:

## ATE\_IND.1.1C

The TOE shall be suitable for testing.

## 7.5.1.3 Evaluator action elements:

## ATE\_IND.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

# ATE\_IND.1.2E

The evaluator shall test a subset of the TSF to confirm that the TSF operates as specified.

# 7.6 Class AVA: Vulnerability Assessment

# 7.6.1 Vulnerability Survey (AVA\_VAN.1)

## 7.6.1.1 **Developer action elements:**

## AVA\_VAN.1.1D

The developer shall provide the TOE for testing.

## 7.6.1.2 *Content and presentation elements:*

## AVA\_VAN.1.1C

The application shall be suitable for testing.

#### 7.6.1.3 Evaluator action elements:

## AVA\_VAN.1.1E

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

# AVA\_VAN.1.2E

The evaluator shall perform a search of public domain sources to identify potential vulnerabilities in the TOE.

# AVA\_VAN.1.3E

The evaluator shall conduct penetration testing, based on the identified potential vulnerabilities, to determine that the TOE is resistant to attacks performed by an attacker possessing Basic attack potential.

# **8 TOE Summary Specification**

The following sections identify the security functions of the TOE and describe how the TSF meets each claimed SFR. They include Cryptographic Support, User Data Protection, Identification and Authentication, Security Management, Privacy, Protection of the TSF, and Trusted Path/Channels.

# 8.1 Cryptographic Support

[iOS] TLS communication and S/MIME cryptographic services for Boxer application installed on an iPhone device are provided by the underlying platform. The specific cryptographic implementation for the iOS platform can be found in the Apple iOS 16 Security Target documentation (VID11349).

[iPadOS] TLS communication and S/MIME cryptographic services for Boxer application installed on an iPad device are provided by the underlying platform. The specific cryptographic implementation for the iPadOS platform can be found in the Apple iPadOS 16 Security Target documentation (VID11350).

[Android] TLS communication cryptographic services for the Boxer application installed on a Samsung Galaxy device is provided by the underlying platform. The specific cryptographic implementation for the Android platform can be found in the Samsung Android 13 Security Target documentation (VID11342).

Additionally, when Boxer is installed on a device running the Android OS 13, the application includes OpenSSL software library 3.0 to perform the cryptographic services for S/MIME functionality. The CAVP certificates for Boxer's OpenSSL Android implementation are specified in Table 15.

OpenSSL Algorithm for S/MIME	SFR	Operational Environment	Consolidated CAVP Cert. #

**Table 16: Cryptographic Libraries** 

# 8.1.1 [APP\_PP] FCS\_CKM\_EXT.1 and FCS\_CKM.1.1/AK

The TOE uses assigned certificates that are generated through the UEM Server (operational environment) communicating with a certificate authority server. The assigned certificates are used for user S/MIME functionality.

The TOE invokes the platform to support asymmetric key generation in support of TLS communications. The platform provided functionality supports both RSA schemes using cryptographic key sizes of 2048-bit or greater that meet FIPS PUB 186-4, "Digital Signature Standard (DSS)", Appendix B.3 and ECC schemes using "NIST curves" P-256, P-384 that meet FIPS PUB 186-4, "Digital Signature Standard (DSS)", Appendix B.4.

# 8.1.2 [APP\_PP] FCS\_CKM.2

The TOE invokes the platform in support of two key establishment schemes for the establishment of TLS communications:

- RSA key establishment conforming to "NIST SP 800-56B",
- Elliptic curve-based key establishment conforming to NIST Special Publication 800-56A.

The TOE invokes the platform-provided functionality to perform Cryptographic Key Establishment for both Apple iOS 16 (VID11349), Apple iPadOS 16 (VID11350), and Android 13 (VID11342).

## 8.1.3 **[EC\_EP] FCS\_CKM\_EXT.3**

Keys are wrapped according to the chain process described in FCS\_KYC\_EXT.1 and each iteration of FCS\_COP\_EXT.2. See Section 8.1.15 FCS\_STO\_EXT.1(1): Table 17 and Table 18 for the description on secure storage (volatile and non-volatile), destruction, and usage of keys.

## 8.1.4 [EC EP] FCS CKM EXT.4

The TOE invokes and implements key destruction on all platforms. The method is dependent on the key and its storage location as to whether the TOE will implement or invoke this functionality.

When a plaintext or private key stored in volatile or non-volatile memory is no longer needed, for example a TLS communication session closed, task completed, or the application being wiped, the TOE either implements or invokes the platform to perform the key destruction. Key destruction performed by

Boxer is done with a single overwrite consisting of zeroes before releasing the volatile memory and a single overwrite consisting of a static pattern of zeroes before releasing the non-volatile storage space that meet NIST SP800-88. Key destruction performed by the OS is done in accordance with:

[Android] The specific cryptographic implementation for the Android platform can be found in the Samsung Electronics Co., Ltd. Samsung Galaxy Devices on Android 13 – Spring Security Target documentation (VID11342).

[iOS] The specific cryptographic implementation for the iOS platform can be found in the Apple iOS 16 Security Target documentation (VID11349).

[iPadOS] The specific cryptographic implementation for the iPadOS platform can be found in the Apple iPadOS 16 Security Target documentation (VID11350).

See Section 8.1.15 FCS\_STO\_EXT.1(1): Table 17 and Table 18 describe the circumstances in which the key is no longer needed for volatile and nonvolatile memory. The tables also identify the mechanism (OS or Boxer) which is responsible for the destruction of the keys.

# 8.1.5 **[EC\_EP] FCS\_CKM\_EXT.5**

The TOE implements a password/passphrase for key chaining. The TOE supports a password of up to 512 characters. The supported character sets include: upper case, lower case, numeric, and only the following special characters "!", "@", "#", "\$", "%", "%", "\*", "(", and ")". Passwords are not accepted if they are less than the required length configurable by the administrator or are greater than 512 characters.

The TOE performs a password-based key derivation function in accordance with the HMAC-SHA-256 algorithm, defined in COP.1/KeyedHash. The key derivation function is performed with the password string without padding, a salt of 256 bits, 10K iterations (iOS), 10K iterations (iPadOS), and 20K iterations (Android), and with an output cryptographic key size of 256 bits that meets NIST SP 800-132.

# 8.1.6 [APP\_PP] FCS\_COP.1/SKC

The TOE supports AES encryption/decryption for FCS\_SMIME\_EXT.1.2.

[Android] The TOE implements the cryptographic support the AES encryption/decryption for S/MIME using AES-256-CBC and AES-128-CBC. This cryptographic functionality is handled by the TOE's OpenSSL implementation.

The Boxer database is encrypted using the included SQLCipher API, which uses AES-256-CBC encryption/decryption services provided by the TOE's OpenSSL implementation, in support of FCS\_STO\_EXT.1(1) and FCS\_STO\_EXT.1(2).

Additionally, the TOE implements AES-256-CTR in support of AES\_CTR DRBG services.

The following is included for completeness in addressing FCS\_STO\_EXT.1(1) and FCS\_STO\_EXT.1(2) as it references FCS\_COP.1/SKC.

[iOS] The iOS platform provides the cryptographic support for the AES encryption/decryption for S/MIME using AES-256-CBC and AES-128-CBC.

The Boxer database is encrypted using the included SQLCipher API, which uses AES-256-CBC encryption/decryption services provided by the iOS platform, to support FCS\_STO\_EXT.1(1)

and FCS\_STO\_EXT.1(2). See FCS\_COP.1/SKC in the Apple iOS 16 Security Target documentation (VID11349) for the AES-128-CBC and AES-256-CBC declaration.

[iPadOS] The iOS platform provides the cryptographic support for the AES encryption/decryption for S/MIME using AES-256-CBC and AES-128-CBC.

The Boxer database is encrypted using the included SQLCipher API, which uses AES-256-CBC encryption/decryption services provided by the iOS platform, to support FCS\_STO\_EXT.1(1) and FCS\_STO\_EXT.1(2). See FCS\_COP.1/SKC in the Apple iPadOS 16 Security Target documentation (VID11350) for the AES-128-CBC and AES-256-CBC declaration.

# 8.1.7 [APP\_PP] FCS\_COP.1/Hash

The TOE supports the use of SHA-256, SHA-384, and SHA-512 for S/MIME functionality as defined in FCS\_SMIME\_EXT.1.3.

[Android] This cryptographic functionality is handled by the TOE's OpenSSL implementation.

[iOS] This cryptographic functionality is handled by the iOS platform.

[iPadOS] This cryptographic functionality is handled by the iPadOS platform.

The following specifies the selected algorithms, key sizes, and message digest sizes respectively:

- SHA-256, 256, 256
- SHA-384, 384, 384
- SHA-512, 512, 512

# 8.1.8 [APP\_PP] FCS\_COP.1/Sig

The TOE uses sha256withRSAEncryption for the signatureAlgorithm (RSA scheme) for digital signature services in support of S/MIME functionality as defined in FCS\_SMIME\_EXT.1.4. RSA scheme with a key size of 2048 bits is supported.

[Android] This cryptographic functionality is handled by the TOE's OpenSSL implementation.

[iOS] This cryptographic functionality is handled by the iOS platform.

[iPadOS] This cryptographic functionality is handled by the iPadOS platform.

# 8.1.9 [APP\_PP] FCS\_COP.1/KeyedHash

The TOE performs a password-based key derivation function in accordance with the HMAC-SHA-256 algorithm with a 256 bit key size and 256 message digest size (defined by FCS\_CKM\_EXT.5.3).

[Android] This cryptographic functionality is handled by the TOE's OpenSSL implementation.

[iOS] This cryptographic functionality is handled by the iOS platform.

[iPadOS] This cryptographic functionality is handled by the iPadOS platform.

# 8.1.10 [EC\_EP] FCS\_COP\_EXT.2(iOS), [EC\_EP] FCS\_COP\_EXT.2(Android), and [EC\_EP] FCS\_COP\_EXT.2(iPadOS)

[Android] The TOE implements functionality to perform Key Wrapping using AES Key Wrap with a cryptographic key size 256-bits that meets NIST SP 800-38F for Key Wrap (section 6.2).

[iOS] The TOE uses the platform to perform the Key Wrapping using AES Key Wrap with a cryptographic key size 256-bits that meets NIST SP 800-38F for Key Wrap (section 6.2).

[iPadOS] The TOE uses the platform to perform the Key Wrapping using AES Key Wrap with a cryptographic key size 256-bits that meets NIST SP 800-38F for Key Wrap (section 6.2).

See Section 8.1.15 FCS\_STO\_EXT.1(1): Table 17 and Table 18 for the description on secure storage, destruction, and usage of keys.

# 8.1.11 **[EC\_EP] FCS\_IVG\_EXT.1**

The TOE creates IVs using the CBC encryption mode meaning that the IVs are non-repeating.

# 8.1.12 [EC\_EP] FCS\_KYC\_EXT.1

For both Android, iOS and iPadOS, the user enters a password according to the policy set forth by FCS\_CKM\_EXT.5. This key is processed as prescribed in each iteration of FCS\_COP\_EXT.2 and results in a 256-bit key (Password Key). The derived Password Key is only stored in volatile memory (RAM) and is always recreated when the user is required to enter the password to unlock the application, such as the first time executing the application after a reboot of the mobile device or restart of the app. Users using the iOS or iPadOS may also input biometrics utilizing the Touch ID feature. A Touch ID key is randomly generated using iOS-platform or iPadOS-platform provided functionality. The Key Chaining process is the same with the exception of using the Touch ID key instead of the Password Key. The term "SecurePref storage" means a VMware key grouping within the Boxer database. The term "SharedPref" means an Android key/value pair persistent storage mechanism (keystore).

#### Android Key Chaining Process:

When the application is not running (i.e., first time login from a reboot):

- The user inputs password or biometric unlock or device pin
- The Passphrase Key is derived (SHA1 hashed and encoded version of the password)
- The encrypted Key Encryption Key (KEK1) is pulled from *SharedPrefs* storage
- The encrypted Key Encryption Key is then decrypted using Passphrase Key

Or when the session is running in background:

- Session Key in memory and stored in *SharedPrefs*
- The encrypted Key Encryption Key (KEK2) is pulled from *SharedPrefs* storage
- The encrypted Key Encryption Key is then decrypted using Session Key
- The encrypted Master key is pulled from SharedPrefs storage
- The encrypted Master Key is then decrypted using Key Encryption Key
- The encrypted Boxer Database Key is then pulled from SecurePref storage
- The encrypted Boxer Database Key is then decrypted using the Master Key

Access to Boxer Database is now available

# iOS Key Chaining Process:

- The user inputs password or biometric unlock or device pin
- The Password Key/Touch ID Key is derived
- The encrypted Master Key is pulled from iOS keychain
- The Master Key is then decrypted using Password Key/Touch ID key
- The encrypted Boxer App Key is pulled from iOS keychain
- The encrypted Boxer App Key is decrypted using Master Key
- The encrypted Boxer Master Key is then pulled form iOS keychain
- The encrypted Boxer Master Key is decrypted using Boxer App Key
- The encrypted Boxer Database key is pulled from iOS keychain
- The encrypted Boxer Database Key is then decrypted using Boxer Master Key
- Access to Boxer Database is now available

# iPadOS Key Chaining Process:

- The user inputs password or biometric unlock or device pin
- The Password Key/Touch ID Key is derived
- The encrypted Master Key is pulled from iPadOS keychain
- The Master Key is then decrypted using Password Key/Touch ID key
- The encrypted Boxer App Key is pulled from iPadOS keychain
- The encrypted Boxer App Key is decrypted using Master Key
- The encrypted Boxer Master Key is then pulled form iPadOS keychain
- The encrypted Boxer Master Key is decrypted using Boxer App Key
- The encrypted Boxer Database key is pulled from iPadOS keychain
- The encrypted Boxer Database Key is then decrypted using Boxer Master Key
- Access to Boxer Database is now available

See Section 8.1.15 FCS\_STO\_EXT.1(1): Table 17 and Table 18 for the description on secure storage, destruction, and usage of keys.

# 8.1.13 [APP\_PP] FCS\_RBG\_EXT.1(iOS), [APP\_PP] FCS\_RBG\_EXT.1(Android), [APP\_PP] FCS\_RBG\_EXT.1(iPadOS), and [APP\_PP] FCS\_RBG\_EXT.2

[Android] When installed on an Android platform, the TOE implements its own DRBG functionality and invokes the platform's DRBG services, depending upon the function.

The TOE implements OpenSSL to provide NIST SP 800-90A compliant AES\_CTR DRBG services (see Table 15 for certificate number) for the cryptographic functionality specified in the [EC\_EP]. There is no ability to specify the use of an alternative DRBG. The TOE's DRBG is seeded with a minimum of 256-bits entropy data that is collected from /dev/random or /dev/urandom depending on the function. The amount of entropy that is collected is based on the function that the DRBG is being used for. In all cases, this amount is greater than or equal to the security strength of the data that is being outputted. The entropy source is described in greater detail in the proprietary Entropy Assessment Report.

The TOE invokes the platform's BoringSSL cryptography to provide NIST SP 800-90A compliant AES\_CTR DRBG functionality for trusted communications between the TOE and email Exchange server.

The specific cryptographic implementation for the Android platform can be found in the Samsung Electronics Co., Ltd. Samsung Galaxy Devices on Android 13 – Spring Security Target documentation (VID11342). When the application invokes the platform to obtain random numbers, the platform APIs used are /dev/random and /dev/urandom APIs depending on function. The TOE also implements its own DRBG function using OpenSSL. The random numbers are obtained using /dev/random or /dev/urandom depending on the function when OpenSSL is being used.

[iOS] When installed on an iOS platform, the TOE invokes the platform's CoreCrypto module to provide NIST SP 800-90A compliant AES\_CTR DRBG functionality for trusted communications between the TOE and email Exchange server. The CoreCrypto AES\_CTR DRBG services also provide support for the cryptographic functionality specified in the [EC\_EP]. The specific cryptographic implementation for the iOS platform can be found in the Apple iOS 16 – Security Target documentation (VID11349). The platform API used to obtain random numbers is SecRandomCopyBytes().

[iPadOS] When installed on an iPadOS platform, the TOE invokes the platform's CoreCrypto module to provide NIST SP 800-90A compliant AES\_CTR DRBG functionality for trusted communications between the TOE and email Exchange server. The CoreCrypto AES\_CTR DRBG services also provide support for the cryptographic functionality specified in the [EC\_EP]. The specific cryptographic implementation for the iPadOS platform can be found in the Apple iPadOS 16 – Security Target documentation (VID11350). The platform API used to obtain random numbers is SecRandomCopyBytes().

# 8.1.14 [EC\_EP] FCS\_SMIME\_EXT.1

The TOE implements both a sending and receiving S/MIME v4.0 Agent as defined in RFC 8551, using CMS as defined in RFCs 5652, 5754, and 3565. The TOE uses AES-256-CBC (FCS\_COP.1/SKC) as its default for transmitting the ContentEncryptionAlgorithmIdentifier. The administrator is able to configure the TOE to use AES-128-CBC as well. For the digestAlgorithm, the TOE implements id-sha256 by default. This is also configurable by the administrator to use id-sha384 and id-sha512 (FCS\_COP.1/Hash). The TOE uses sha256withRSAEncryption for the signatureAlgorithm by default (FCS\_COP.1/Sig). Only a certificate with the digitalSignature bit set will be accepted as part of the S/MIME protocol. The TOE supports the use of different private keys for signature and for encryption as part of the S/MIME protocol.

Certificate revocation information is received from the OCSP responder at a frequency defined by the server. An UEM administrator may override this frequency by configuring a value via UEM.

Certificates are pulled from the signed email when received in the application in order to validate the authenticity and integrity of the email.

# 8.1.15 [APP\_PP] FCS\_STO\_EXT.1(1)

There are two groupings of keys/credentials:

• **Keys used to unlock Boxer for operational use:** Keys that the OS platform (iOS, iPadOS, or Android) is invoked to store in the platform's keystore/keychain.

- Keys/Credentials Considered Configuration Data used by Boxer for operational functionality: Keys/credentials that are considered sensitive configuration data that the TOE stores in its internal encrypted Boxer database.
  - [Android] The Boxer database is encrypted, using the included SQLCipher API which
    uses the TOE's OpenSSL implementation for AES-256-CBC encryption/decryption
    services on the Android platform, per FCS\_COP.1/SKC of this ST (TOE implements).
  - o [iOS] The Boxer database is encrypted, using the included SQLCipher API which invokes the iOS platform for AES-256-CBC encryption/decryption services provided by the iOS platform (TOE invokes).
  - [iPadOS] The Boxer database is encrypted, using the included SQLCipher API which invokes the iPadOS platform for AES-256-CBC encryption/decryption services provided by the iPadOS platform (TOE invokes).
  - Additionally, the Boxer database is protected by the iOS/iPadOS/Android platform filebased encryption as defined in FDP\_DAR\_EXT.1 providing a double encryption protection scheme for the Boxer database.

The following table identifies the keys/credentials that are used by the TOE, how and where they are stored, how and when they are destroyed, and the purpose as scoped by [APP\_PP] and [EC\_EP]:

- Any keys/credentials saved to the internal encrypted Boxer database maps to the "implement functionality" selection.
- The term "SecurePref" means a VMware created key grouping within the Boxer database.
- The term "SharedPref" means an Android key/value pair persistent storage mechanism (keystore).
- The term "App Wipe" is a remote wipe accomplished from the UEM console and "App Uninstall" is when a user removes it manually from the OS App listing.

Keys used Directly / Indirectly to unlock Boxer application (invoke)	Volatile	Non-volatile Keychain	Description
User entered Password/passcode	Used in memory Cleared by OS:	Not persistently stored	User password entry
Passphrase Key	Used in memory Zeroed by Boxer:  • Task completion	Not persistently stored	This is a SHA1 hashed and encoded version of the key above (User entered Password/passcode)
Session Key	Used in memory Cleared by Boxer:  • App Wipe Cleared by OS:	Android: Stored in SharedPrefs and protected by the Android hardware-	Primary key to be used to get to Key Encryption Key while

	Device Reboot	backed crypto services	the application is
		API keystore.	running
		Cleared by OS:	
		App Uninstall	
		Android: Stored in	
		SharedPrefs and protected	
	Used in memory	by the Android hardware-	
Biometric Key (i.e.,	Not kept in Memory	backed crypto services	Used only to unwrap
TouchID Key)	Zeroed by Boxer:	API keystore	Master Key and start
•	Session establishment	7 11 5	creating a session
	completed	Zeroed by Boxer:	
		App Wipe	
		Passcode change	
		Android: Stored in	
		SharedPrefs and protected	
	Used in memory	by the Android hardware-	
Device Pin Based	Not kept in Memory	backed crypto services	<ul> <li>Used only to unwrap</li> </ul>
Key	Zeroed by Boxer:	API keystore	Master Key and start
Rey	Session establishment		creating a session
	completed	Zeroed by Boxer:	
		<ul> <li>App Wipe</li> </ul>	
		Passcode change	
Key Encryption Key (KEK)	Used in memory Kept in Memory wrapped with Session Key (KEK2) until: Cleared by Boxer:  • App Wipe	Wrapped using Passphrase Key and saved in SharedPrefs (KEK1) Wrapped using the Session Key and saved in SharedPrefs (KEK2) Cleared by OS:  • App Uninstall	<ul> <li>Randomly generated at installation</li> <li>KEK used to encrypt Master Key</li> <li>The Key Encryption Key #1 and #2 is derived by encrypting the randomly generated Key Encryption Key with the Passphrase Key and Session Key respectively</li> <li>When the mobile device user enters the correct passcode, then KEK1 can be decrypted to reproduce the KEK for use in volatile memory</li> <li>When an active session, the KEK2 can be decrypted to reproduce the KEK for us in volatile memory</li> </ul>

Master Key  Keys/credentials	Used in memory Cleared by OS:  • Device Reboot	Wrapped using KEK and saved in SharedPrefs Cleared by OS:  • App Uninstall	<ul> <li>Randomly generated at installation</li> <li>Used to encrypt the Boxer database Key</li> </ul>
exclusively for operational Boxer (implement)	Volatile	Non-volatile Keychain	Description
Boxer Database Key	Used in memory Cleared by Boxer:  • App Wipe Cleared by OS: Device Reboot	Wrapped using Master Key and saved in SecurePref  Cleared by OS:  • App Uninstall AES wrapped with Master Key and stored in Android Shared preferences.	Randomly generated at installation  Used to encrypt/decrypt Boxer  Database providing access to mail data
Authentication Credential Password	Used in memory Cleared by Boxer:  • App Wipe Cleared by OS:  • Device Reboot	Persistently stored in encrypted Boxer database Cleared by OS: App Uninstall	Used to authenticate boxer client with Exchange server
Authentication credential Communication Certificate	Used in memory Cleared by Boxer:  • App Wipe Cleared by OS:  • Device Reboot	Certificate is AES wrapped and stored in Boxer database Cleared by OS:  • App Uninstall • Overwritten when a new certificate is generated	Used for communication with Exchange server
S/MIME certificates containing public + private keys (1 for Encryption 1 for signing or the same certificate for both signing and encryption)	Used in memory Cleared by Boxer:	Certificate is stored in the SecurePref. Cleared by OS:	Used for S/MIME
Sensitive Data exclusively for operational Boxer (FDP_DAR_EXT.1)	Volatile	Non-volatile (db)	Description

Public Key of email recipient	Used in memory Cleared by OS:  • App Uninstall	Certificates are stored in the encrypted Boxer database Cleared by OS:  • App Uninstall Public Certificate and its Certificate chain are temporarily stored on the file system for the duration of the encryption/signature verification	Used for S/MIME
Attachment Encryption Key	Used in memory Available only when accessing the attachment Zeroed by Boxer:  • Task Completion (Decryption of attachment completed)	Encrypted version Stored in encrypted Boxer database Cleared by OS:  • App Uninstall	Used to encrypt attachments stored in the internal file system
Temporary Files Encryption Key	Used in memory Available only when accessing the temporary file Zeroed by Boxer:  • Task Completion (Temporary file no longer in use)	In case of "draft e-mails (before being sent out)": Not stored persistently In case of "incoming S/MIME messages content": Key is key- wrapped using Boxer database key and then encrypted using a static passcode and stored in Shared Preferences. Cleared by OS:  • App Uninstall	Used to store     temporary content Example: Emails before being sent out utilize these files to temporarily store the content and are deleted once the message is sent.

Table 17: Stored Android Credentials

Keys used Directly / Indirectly to unlock Boxer application (invoke)	Volatile	Non-volatile Keychain	Description
Session Key	Used in memory  Zeroed by Boxer:  • App Wipe	Encrypted with App's public key (that was subscribed to share session) and saved in iOS/iPadOS Keychain	Primary key to be used to get to Master Key while the application is running
	Zeroed by OS:  • App Close	Corresponding private key is kept in the running memory of the app	<ul> <li>Used to maintain app specific or shared session across SSO Apps</li> </ul>

		Zeroed by Boxer:	
		App Wipe	
Biometric Key (i.e.,	Used in memory	Wrapped by system and	Used only to unwrap
TouchID Key)	_	stored in Secure Enclave	Master Key and start
roueine negy	Not kept in Memory	by system for type	creating a session
	Zeroed by Boxer:	SecClass Key	creating a session
	• Session

		<ul> <li>Passcode change</li> </ul>	
	Used in memory	Not persistently stored	<ul> <li>Used only to unwrap</li> </ul>
Password Based Key	Not kept in Memory		Master Key and start
			creating a session
	Zeroed by Boxer:		
	Task Completion		• Uses KDF with 10000
	(Session		iterations to convert
	establishment		user input into
Master Key	completed) Used in memory		Password Based Key  • The Master Key #1,
Masici Key		Wrapped with Password	• The Master Key #1, #2, #3 is derived by
	Kept in Memory wrapped	Based Key and saved in	encrypting the
	with Session Key (MK3)	iOS/iPadOS keychain	randomly generated
	Zeroed by Boxer:	(MK1)	Master Key with the
	App Wipe		Password Key,
		Wrapped using Touch ID	Biometric Key, and
	Zeroed by OS:	Key and saved in	Session key
	App Close	iOS/iPadOS keychain	respectively
		(MK2)	
			When the mobile
		Wrapped using Session	device user enters the
		Key and saved in iOS/iPadOS keychain	correct passcode, then
		(MK3)	MK1 can be decrypted to re-produce the
		(WIKS)	Master Key for use in
		Zeroed by OS:	volatile memory
		App Uninstall	volume memory
			When the mobile
			device user enters the
			correct TouchID, the
			MK2 can be decrypted
			to re-produce the
			Master Key for use in
			volatile memory
			XXII
			• When an active
			session, the MK3 can be decrypted to
			reproduce the Master
			Key for use in volatile
			memory
Boxer App Key	Used in memory	Wrapped with Master key	The Boxer App Key is
11 7		and stored in iOS/iPadOS	randomly generated
		Keychain	

	Obfuscated with Master Key which is also kept in memory Zeroed by Boxer:	Destroyed by Boxer:  • App Wipe	<ul> <li>The Boxer App Key is encrypted with the Master Key for storage</li> <li>Used for encrypting/decrypting Boxer Database</li> </ul>
Keys/credentials exclusively for operational Boxer	Volatile	Non-volatile Keychain	Description
(invoke) Boxer Master Key	Used in memory throughout the lifetime of the app  Zeroed by OS:  • App Close	Stored encrypted in the iOS/iPadOS Keychain  Encrypted using the Boxer Application Key  Zeroed by OS:  • App Uninstall	<ul> <li>Randomly generated at installation</li> <li>Used for encrypting all other keys inside the boxer app</li> </ul>
Boxer Database Key	Used in-memory  Zeroed by Boxer:  • Task Completion (Opening Boxer database)	Stored encrypted in the iOS/iPadOS Keychain  Encrypted with the Boxer Master Key  Zeroed by OS:  • App Uninstall	Randomly generated at installation     Used for locking / unlocking the Boxer database
Sensitive Data exclusively for operational Boxer	Volatile	Non-volatile (db)	Description
(FDP_DAR_EXT.1) File Encryption Keys	Used in-memory  Zeroed by Boxer:  • Task Completion (File Read or Write)	Stored encrypted in the Boxer database  Encrypted with the Boxer Master Key  Zeroed by OS:  • App Uninstall	Used for encrypting / decrypting files on filessystem
S/MIME Private Keys	Used in-memory  Loaded on demand  Zeroed by OS:  • App Close	Stored encrypted in the Boxer database  Encrypted with the Boxer Master Key  Zeroed by OS:  • App Uninstall	Used for encrypting / decrypting S/MIME email messages
Exchange CBA Certificate	Used in memory throughout the lifetime of the app	Stored encrypted in the Boxer database  Zeroed by Boxer:	Used for Client-Server authentication with Exchange

	Zeroed by OS:  • App Close	<ul><li>App Wipe</li><li>Zeroed by OS:</li><li>App Uninstall</li></ul>	
Exchange Basic Authentication Password	Used in memory throughout the lifetime of the app Zeroed by OS:  • App Close	Stored encrypted in the Boxer database  Zeroed by Boxer:  • App Wipe  Zeroed by OS:  • App Uninstall	Used for Client-Server authentication with Exchange

Table 18: Stored iOS/iPadOS Credentials

# 8.1.16 [APP\_PP] FCS\_STO\_EXT.1(2)

The Boxer application stores S/MIME revocation status information in the Boxer database. The following information is stored:

- Certificate Identifier
- Certificate Revocation Status
- Validation Failure Reason
- Next Revocation Check Date
- Last Revocation Checked Date

The information is overwritten when information is refreshed. The revocation status information is deleted upon the Boxer application removal.

[Android] These objects are stored in the encrypted Boxer database. The Boxer database is encrypted, using the included SQLCipher API which uses AES-256-CBC encryption/decryption services provided by the TOE's OpenSSL implementation on the Android platform, per FCS\_COP.1/SKC of this ST (TOE implements).

[iOS] These objects are stored in the encrypted Boxer database. The TOE invokes the iOS platform to encrypt the Boxer database, using the included SQLCipher API which uses AES-256-CBC encryption/decryption services provided by the iOS platform (TOE invokes).

[iPadOS] These objects are stored in the encrypted Boxer database. The TOE invokes the iPadOS platform to encrypt the Boxer database, using the included SQLCipher API which uses AES-256-CBC encryption/decryption services provided by the iPadOS platform (TOE invokes).

# 8.2 User Data Protection

# 8.2.1 **[APP\_PP] FDP\_DAR\_EXT.1**

The TOE relies on the underlying platforms (iOS, iPadOS, and Android) to provide data-at-rest encryption for all saved data files including the already encrypted Boxer database.

[Android] The Android platform automatically enforces file-based encryption (FBE) using AES-256-XTS encryption. The TOE's file creation scheme requires sensitive data files to be saved with the MODE\_PRIVATE flag set. All instances where files containing sensitive data are stored call the getSharedPreferences(String name, int mode) method (which is an overridden method defined in the Boxer application source code) with the "MODE\_PRIVATE" flag as the second parameter. Sensitive data

includes: calendar, address book (i.e., contacts), system accounts, and profiles which are stored in the internal Boxer database that is fully encrypted in addition to the file encryption (double encryption).

[iOS] The iOS platforms automatically enforces file-based encryption (FBE) through Apple's Data Protection which uses AES-128-XTS or AES-256-XTS, dependent on the family devices, for encryption. The TOE's file creation scheme requires sensitive data files to use Data Protection's Protected Until First User Authentication Data Protection Class for each data file stored locally. Sensitive data includes: calendar, address book, system accounts, and profiles which are stored in an internal Boxer database that is fully encrypted in addition to the file-based encryption (double encryption). All instances where sensitive data files are stored rely on the NSFileProtectionCompleteUntilFirstUserAuthentication declaration in "VMwareBoxer.entitlements", which is contained in the TOE .ipa file and is enforced in code.

[iPadOS] The iPadOS platforms automatically enforces file-based encryption (FBE) through Apple's Data Protection which uses AES-128-XTS or AES-256-XTS, dependent on the family devices, for encryption. The TOE's file creation scheme requires sensitive data files to use Data Protection's Protected Until First User Authentication Data Protection Class for each data file stored locally. Sensitive data includes: calendar, address book, system accounts, and profiles which are stored in an internal Boxer database that is fully encrypted in addition to the file-based encryption (double encryption). All instances where sensitive data files are stored rely on the NSFileProtectionCompleteUntilFirstUserAuthentication declaration in "VMwareBoxer.entitlements", which is contained in the TOE .ipa file and is enforced in code.

# 8.2.2 [APP\_PP] FDP\_DEC\_EXT.1(iOS), [APP\_PP] FDP\_DEC\_EXT.1(Android), and [APP\_PP] FDP\_DEC\_EXT.1(iPadOS),

The TOE restricts its access and provides user awareness for the intent to access the following hardware resources:

[Android] The hardware access is defined as part of the manifest that can be accessed from the Play Store. It will also be displayed on-access.

- network connectivity
- camera
- NFC
- device storage
- phone
- fingerprint
- vibrator

Access to the following sensitive information repositories are also defined in the manifest and will be displayed on-access.

- address book (i.e., contacts)
- calendar
- accounts
- profile

[iOS] The iOS displays the warnings when access is required.

- network connectivity
- camera
- device storage
- phone
- touch/face ID

The product also displays warnings before accessing the following sensitive information:

- address book (i.e., contacts)
- calendar

[iPadOS] The iPadOS displays the warnings when access is required.

- network connectivity
- camera
- device storage
- phone
- touch/face ID

The product also displays warnings before accessing the following sensitive information:

- address book (i.e., contacts)
- calendar

# 8.2.3 [APP\_PP] FDP\_NET\_EXT.1

The TOE does not invoke or implement any listening ports. The TOE requires network access to facilitate remote administration (via UEM) as well as communicating with the Exchange server. The TOE supports the following <u>user-initiated</u> communications connections:

• Exchange server for sending email, forcing a sync (calendar, address book, and emails), GAL lookup, and email search.

The TOE <u>application invokes</u> the platform to initiate the following SFR-supporting operational environment connections:

- Exchange server (ActiveSync: (calendar, address book, email))
- OCSP responder for S/MIME revocation checking
- Automatic Version Information Check Server(s)
  - o [Android]: Amazon Server
  - o [iOS]: Akamai Server
  - o [iPadOS]: Akamai Server

Note: This is not the same as the OS querying the respective app stores for available updates. The TOE invokes the OS to automatically query the above servers for the latest VMware published version information to notify the end user when a new version is available from within the application.

Additionally, the TOE <u>application invokes</u> the platform to initiate the following non-SFR supporting operational environment connections to:

- [Android, iOS, and iPadOS] Apteligent service for reporting app crashes and exceptions hosted in Amazon.
- [iOS and iPadOS] Cloudfront VMware service to get images to display for certain icons hosted in Amazon.
- [iOS and iPadOS] Automattic, Inc Gravatar services to fetch profile image for a sender of an email using sender's e-mail address.
- [iOS and iPadOS] AirWatch LLC OCSP responder for discovering an existing configuration for a given email address.

# 8.2.4 **[EC\_EP] FDP\_NOT\_EXT.1**

When the email content is viewed, the TOE shows a notification icon between the header and the body of the email. A seal symbol indicates the email has been signed. A lock symbol indicates the email has been encrypted. Both symbols are displayed when the email has been signed and encrypted. The notification icon uses color coding to help the user quickly identify if there are any issues with the validity of the signer or email. The icon is: black to indicate the certificate is verified and trusted; orange to indicate the email is from an untrusted signer; red to indicate the email has been tampered with. If the email is from an untrusted signer, then the user is provided with option to manually accept the certificate.

When displaying the list of emails, a seal symbol is used to notify the user that the email is signed and a lock symbol is used to notify the user that the email is encrypted. Both symbols are displayed if the mail is signed and encrypted. Signature validity is not displayed until the message is opened.

## 8.2.5 [EC\_EP] FDP\_SMIME\_EXT.1

The TOE uses S/MIME for signing, encrypting, verifying, and decrypting email. S/MIME is implemented as specified in FCS\_SMIME\_EXT.1. The signature verification and decryption occur at the receipt of the message. The messages are not stored with their S/MIME envelopes.

# **8.3** Identification and Authentication

# 8.3.1 [APP\_PP] FIA\_X509\_EXT.1

The TOE platform, regardless of OS, performs certificate validation for certificates used for TLS communications. The following is checked in order to determine if a given certificate is valid:

- Certificate validation and certificate path validation conforms to RFC 5280.
- The certificate path must terminate with a trusted CA certificate.
- All CA certificates must have the basicConstraints extension present and the CA flag set to TRUE.
- The TOE uses the Online Certificate Status Protocol (OCSP) as specified in RFC 6960 to verify revocation status. The certificate must not be revoked.
- The extendedKeyUsage field must be valid based on the following rules:
  - o Certificates used for trusted updates and executable code integrity verification must have the Code Signing purpose (id-kp 3 with OID 1.3.6.1.5.5.7.3.3) in the extendedKeyUsage

field.

- Server certificates presented for TLS must have the Server Authentication purpose (id-kp with OID 1.3.6.1.5.5.7.3.1) in the extendedKeyUsage field.
- O Client certificates presented for TLS must have the Client Authentication purpose (id-kp 2 with OID 1.3.6.1.5.5.7.3.2) in the extendedKeyUsage field.
- o S/MIME certificates presented for email encryption and signature must have the Email Protection purpose (id-kp 4 with OID 1.3.6.1.5.5.7.3.4) in the extendedKeyUsage field.
- OCSP certificates presented for OCSP responses must have the OCSP signing purpose (id-kp 9 with OID 1.3.6.1.5.5.7.3.9) in the extendedKeyUsage field.
- o Server certificates presented for EST must have the CMC Registration Authority (RA) purpose (id-kp-cmcRA with OID 1.3.6.1.5.5.7.3.28) in the extendedKeyUsage field.

The certificate validation service will ensure that all certificate paths terminate with a trusted root CA certificate and that all CA certificates include the basicConstraints extension with the CA flag set to TRUE. Certificate status is validated using OCSP. The certificate validation service will also ensure that the extendedKeyUsage field is properly set for all certificates depending on their intended usage.

# 8.3.2 [APP\_PP] FIA\_X509\_EXT.2

The TOE uses X.509v3 certificates to support the establishment of TLS connections to the Exchange server. The use of certificates is enabled by default. The administrator may also specify the path to an OCSP responder so that revocation status can be checked during authentication. The trusted CA certificates to be used by the TOE are specified through the UEM console. The TLS implementation will automatically reject a certificate if it is found to be invalid. The UEM administrator is able to specify the default action when the application/platform cannot reach the OCSP responder, so that the TOE will either:

- Strict setting: Reject the certificate.
- Moderate setting: Accept the certificate if the last revocation status is valid. Reject the certificate if the last known revocation status is unknown or was revoked.

# 8.3.3 **[EC\_EP] FIA\_X509\_EXT.3**

X.509v3 certificates as defined by RFC 5280, are used for S/MIME functionality and are transmitted from the UEM server to the Boxer application upon initial launch of the application and subsequent launches if new certificates are available.

When the underlying application/platform cannot reach the OCSP responder, the UEM administrator is able to specify the default action so that the TOE will either:

- Reject the certificate or
- Accept the certificate if the last revocation status is valid. Reject the certificate if the last known revocation status is unknown or was revoked.

The email client will prevent the encryption and/or signing of an email if the email protection certificate is deemed invalid.

# **8.4** Security Management

# 8.4.1 [APP\_PP] FMT\_CFG\_EXT.1

There are no default credentials for the TOE. All credentials would be pre-existing on the Exchange server or UEM server, which are separate entities to the TOE. The TOE software is installed by default with the appropriate permissions to prevent unauthorized access.

# 8.4.2 [APP\_PP] FMT\_MEC\_EXT.1

The iOS, iPadOS and Android platforms are responsible for file encryption to protect all applications and their data from unauthorized access. The user of the mobile device must enter a passcode to derive the key which is used to unlock the file. Secondly, when enrolling the TOE, it must be enrolled against a server that has a valid pre-existing credentials for the user of the mobile device. Thirdly, the user must enter a passphrase to gain access to the Boxer application and its data. This passphrase is used to derive the Boxer database key that is required to decrypt the Boxer database contents for use when needed. The keys and passcodes are stored as described in FCS\_STO\_EXT.1(1).

[Android] The only user configurable sensitive TSF datum is the application password as defined in FMT\_MOF\_EXT.1, is stored in the SharedPreferences XML file (https://developer.android.com/reference/android/content/SharedPreferences) as a hashed string.

[iOS] The user configurable sensitive TSF datum is the application password as defined in FMT\_MOF\_EXT.1, is stored in the iOS keychain.

[iPadOS] The user configurable sensitive TSF datum is the application password as defined in FMT\_MOF\_EXT.1, is stored in the iPadOS keychain.

# 8.4.3 **[EC\_EP] FMT\_MOF\_EXT.1**

The administrator in this evaluation is considered to be the UEM administrator. The UEM administrator is responsible for setting the configuration of the TOE applications using the UEM console that resides in the operational environment.

The UEM administrator can configure the password length, cryptographic functionality such as specifying what key sizes are used for the cryptographic algorithms in FCS\_SMIME\_EXT.1, OCSP retrieval frequency, S/MIME cryptographic assignments, and enabling/disabling the plaintext only mode globally. The mobile device user is not capable of changing these settings from the mobile device.

The user is the subject that performs management functions on the TOE itself. The TOE allows the user the ability to change one's own password/passphrase. See Supplemental Administrative Guidance for Common Criteria document on how the user defined password authorization factor can be changed.

## 8.4.4 **[APP\_PP] FMT\_SMF.1**

At the TOE application, the User is considered the owner or user of the mobile device for which the TOE is installed. The TOE software provides one function that is considered administrative functionality to the end user according to the [EC\_EP] FMT\_MOF\_EXT.1: change password/passphrase authentication credential. The User of the Android, iOS, and iPadOS platforms may change their password/passphrase authentication credentials. For the Android, iOS, and iPadOS platforms an UEM administrator can force a password change by making the password complexity stricter (i.e., increase password length). The user

would be forced to change their password after having successfully authenticated with their old now non-compliant password.

# 8.5 Privacy

# 8.5.1 [APP\_PP] FPR\_ANO\_EXT.1

The TOE application does not collect personally identifiable information (PII) for administrators or users. Therefore, the TOE application will not transmit PII data over the network unless the user of the mobile device includes such information in the free text email. Free text in an email is outside the TOE's scope of control.

## **8.6** Protection of the TSF

# 8.6.1 [APP\_PP] FPT\_AEX\_EXT.1

The TOE implements several mechanisms to protect against exploitation.

[Android] The TOE is compiled using the -fPIE and -pie compilation flags to ensure it is a Position Independent Executable (ASLR). Memory map (mmap) is never invoked with both the PROT\_WRITE and PROT\_EXEC permissions. Additionally, mprotect is never invoked. User modifiable files are written to /data/data/com.boxer.email and there are also no executable files.

[iOS] The TOE is compiled using the LD\_NO\_PIE=NO compilation flag to ensure it is a Position Independent Executable (ASLR). All uses of mmap have the explicit memory address location parameter set to NULL (or 0) with the exception of when mmap is called to reallocate memory to expand the Boxer database file map. Additionally, mprotect is never invoked with the PROT\_EXEC permission. The platform forces applications to write all data within the application working directory (sandbox).

[iPadOS] The TOE is compiled using the LD\_NO\_PIE=NO compilation flag to ensure it is a Position Independent Executable (ASLR). All uses of mmap have the explicit memory address location parameter set to NULL (or 0) with the exception of when mmap is called to reallocate memory to expand the Boxer database file map. Additionally, mprotect is never invoked with the PROT\_EXEC permission. The platform forces applications to write all data within the application working directory (sandbox).

Additionally, the TOE was compiled using the -fstack-protector-all compilation flag for all platforms.

# 8.6.2 **[EC\_EP] FPT\_AON\_EXT.1**

The TOE does not support the installation of trusted or untrusted add-ons.

## 8.6.3 [APP PP] FPT API EXT.1

When installed on a mobile device with the Android OS, the TOE uses only the following supported platform APIs in order to function.

- androidx.annotation:annotation
- androidx.appcompat:appcompat
- androidx.arch.core:core-runtime
- androidx.arch.core:core-testing

- org.robolectric:shadows-multidex
- org.simpleframework:simple-xml

When installed on a mobile device with the iOS and iPadOS, the TOE uses only the following supported platform APIs in order to function.

- Accelerate.framework
- Accounts.framework
- AddressBook.framework
- AdSupport.framework
- AssetsLibrary.framework
- AudioToolbox.framework
- AVFoundation.framework
- CallKit.framework
- CFNetwork.framework
- Contacts.framework
- CoreData.framework
- CoreFoundation.framework
- CoreGraphics.framework
- CoreLocation.framework
- CoreMedia.framework
- CoreMotion.framework
- CoreTelephony.framework
- CoreText.framework
- CoreVideo.framework
- EventKit.framework
- Foundation.framework
- ImageIO.framework
- libc++

- libiconv
- libresolv
- libsqlite3
- libxml2.2
- libxml2
- libz.tbd
- LocalAuthentication.framework
- MapKit.framework
- MediaPlayer.framework
- MessageUI.framework
- MobileCoreServices.framework
- Photos.framework
- QuartzCore.framework
- QuickLook.framework
- SafariServices.framework
- Security.framework
- Social.framework
- SystemConfiguration.framework
- UIKit.framework
- UserNotifications.framework
- WebKit.framework

# 8.6.4 [APP\_PP] FPT\_IDV\_EXT.1(iOS), [APP\_PP] FPT\_IDV\_EXT.1(Android), and [APP\_PP] FPT\_IDV\_EXT.1(iPadOS)

[Android] The TOE version format is "YY.MM.PP.BB". The vendor operates on a monthly release cycle to incorporate updates and fixes. The first number is based on the last two digits of the year of the release date. The second number is the 2-digit numerical representation of the month of the release date, the third number is based on the patch release under the monthly release number, and the fourth number is based on the internal build number that has been released to the Google Play store.

[iOS] The TOE version format is "YY.MM.PP". The vendor operates on a monthly release cycle to incorporate updates and fixes. The first number is based on the last two digits of the year of the release date. The second number is the 2-digit numerical representation of the month of the release date, and the third number is based on the patch release under the monthly release number.

[iPadOS] The TOE version format is "YY.MM.PP". The vendor operates on a monthly release cycle to incorporate updates and fixes. The first number is based on the last two digits of the year of the release date. The second number is the 2-digit numerical representation of the month of the release date, and the third number is based on the patch release under the monthly release number.

# 8.6.5 [APP\_PP] FPT\_LIB\_EXT.1

The TOE is packaged with several third-party open source libraries in order to function.

When installed on a mobile device with the Android OS, the TOE uses only the following third-party dynamic libraries in order to function.

- libc++\_shared.so
- libchameleon.so
- libchameleon\_jni.so
- libcoredevice.so
- libcrypto.1.0.2.so
- libdyncdd.so
- libencjni.so
- libfips\_main.so
- libmip\_core.so
- libmip\_protection\_sdk.so
- libmip\_upe\_sdk.so
- libmip\_wrapper.so

- libmod\_settings.so
- libopdatashim.so
- libpolarisoffice8.so
- libscep.so
- libsettings.so
- libsettings\_jni.so
- libsqlcipher.so
- libssl.1.0.2.so
- libsupercollider.so
- libxsw\_crypto.so
- libtunnel sdk.so
- libuidverify.so

When installed on a mobile device with iOS or iPadOS, the TOE uses only the following third-party libraries in order to function.

- AEXML.framework
- AirWatchEWS.framework
- AppAuth.framework
- AppSupportKit.framework
- AWCMWrapper.framework
- AWCrypto.framework
- AWEncryptedStoreKit.framework
- AWError.framework
- AWHelpers.framework
- AWLocalization.framework
- AWLog.framework
- AWPresentation.framework

- AWPrivacy.framework
- AWSDK.framework
- AWServices.framework
- AWStorage.framework
- AWTrustServices.framework
- AWTunnel.framework
- CocoaLumberjack.framework
- CompoundFileReader.framework
- ContentServices.framework
- ContentUIServices.framework
- DerivedCredentialsUsage.framework
- Duktape.framework

# VMware Workspace ONE Boxer Email Client

- EncryptedCoreData.framework
- FMDB.framework
- GRDB.framework
- GRMustache.framework

## 8.6.6 [APP\_PP] FPT\_TUD\_EXT.1 and FPT\_TUD\_EXT.2

The TOE provides a user with the ability to check the version of the TOE that is currently running on the machine.

[Android] Within the application, the TOE will display the version by navigating: Settings  $\rightarrow$  About. The Android OS also provides the versioning information by using the App manager.

[iOS] Within the application, the TOE will display the version by navigating: Settings  $\rightarrow$  About. The iOS also provides the versioning information by using the App manager.

[iPadOS] Within the application, the TOE will display the version by navigating: Settings  $\rightarrow$  About. The iPadOS also provides the versioning information by using the App manager.

The TOE automatically checks to see if an update is available without user intiation. If there is an update available, the user is notified that the product has an update available and directs the user to go to the appropriate app store to download. Additionally, the user can leverage the platform features to independently check for updates by navigating to the Google Play Store (Android) or the Apple App Store (iOS and iPadOS). The TOE does not automatically update its own binaries or executable files. The binary code is only modified or replaced if the user manually initiates the update via the platform provided update mechanism.

The application for Android is packaged in .apk format and for iOS and iPadOS it is packaged in .ipa format.

The TOE and updates to the TOE are provided by the Google Play Store (Android) or Apple App Store (iOS and iPadOS) over HTTPS/TLS. Once the update has been completed by the developer, it is then digitally signed by the developer and sent to the Google Play Store/Apple App Store. The TOE software is digitally signed using a Verisign X.509v3 certificate. The Google Play Store/Apple App Store will then verify the signature and will sign the update with its own signature. When the update gets sent to the mobile device, the mobile device will verify the signature from the Google Play Store/Apple App Store. Secure communication between the mobile device and its app store is handled by the underlying platform. This secure channel is considered part of the operating environment and is out of the scope of the evaluation.

The TOE relies on the platform OS to uninstall the application and remove all remnants of the software from the device. When the TOE application is uninstalled, the entire package is removed. There are no exceptions or customizations for the uninstall function to leave any traces of files or settings.

## 8.6.6.1 Timely Security Updates

As part of providing timely security updates, VMware provides customers with a support section on VMware.com where they have the ability to submit support issues. This is an HTTPS site that requires user authentication prior to use. Any feedback that necessitates a fix will result in an update to Boxer itself so there is no third-party update process to consider when updating the TOE. High severity issues can result in a patch release as soon as remediation is available. Lower severity issues will be incorporated into the next monthly release. Security fixes will be released as new packages in the same manner as any feature updates (see discussion on FPT\_TUD\_EXT.1 above). The TOE contains a number of components, including third-party components that VMware does not have control over the implementation of. Any implementation flaws are expected to be addressed within 90 days of reporting. Customers are notified of security-related fixes on the VMware customer portal.

# 8.7 Trusted Path/Channels

# 8.7.1 [APP\_PP] FTP\_DIT\_EXT.1(iOS), [APP\_PP] FTP\_DIT\_EXT.1(Android), and [APP\_PP] FTP\_DIT\_EXT.1(iPadOS)

The TOE invokes its host platform to communicate with an Exchange Server platform for its primary function as an email client, using the following methods:

[Android] The TOE invokes its host platform to establish a TLSv1.2 channel with the Exchange Server platform to secure all transmitted data via <code>javax.net.ssl.SSLSocketFactory</code>. Once the TLS connection is established between the platforms, the TOE invokes its host platform to use ActiveSync for exchanging email with the Exchange Server via the <code>ApacheHttpClient</code> library which internally uses <code>java.net.HttpURLConnection</code>. In this instance, the TOE platform acts as the TLS client to initiate the secure communications to the Exchange server to send and receive emails.

[iOS] The TOE invokes its host platform to establish a TLSv1.2 channel with the Exchange Server platform to secure all transmitted data via the *NSURLC redential. credential For Trust* system method. Once the TLS connection is established between the platforms, the TOE invokes its host platform to use

ActiveSync for exchanging email with the Exchange Server via the *NSURLSessionTask*. In this instance, the TOE platform acts as the TLS client to initiate the secure communications to the Exchange server to send and receive emails.

[iPadOS] The TOE invokes its host platform to establish a TLSv1.2 channel with the Exchange Server platform to secure all transmitted data via the *NSURLC redential. credential For Trust* system method. Once the TLS connection is established between the platforms, the TOE invokes its host platform to use ActiveSync for exchanging email with the Exchange Server via the *NSURLS ession Task*. In this instance, the TOE platform acts as the TLS client to initiate the secure communications to the Exchange server to send and receive emails.

# 8.7.2 **[EC\_EP] FTP\_ITC\_EXT.1**

As described above in FTP\_DIT\_EXT.1, the TOE implements ActiveSync to communicate with the Exchange server over the TLS v1.2 channel established by the TOE platform. The TOE is able to send and receive emails from the operational environment over this channel.
